Acronyms in This Document

A list of acronyms used in this document.

| Acronym | Definition |
|------------------|-------------------------------|
| FIFO | First In, First Out |
| FPGA | Field Programmable Gate Array |
| I ² C | Inter-Integrated Circuit |
| I/O | Input/Output |
| LED | Light-emitting Diode |
| LPSG | Low Power Strobe Generator |
| PLL | Phase Locked Loop |
| RAM | Random Access Memory |
| SPI | Serial Peripheral Interface |

1. Register Primitives

1.1. SB_DFF - D Flip-Flop

Data: D is loaded into the flip-flop during a rising clock edge transition.

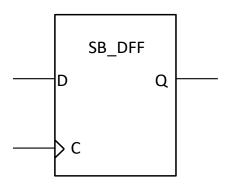

Figure 1.1. SB_DFF - D Flip-Flop

Table 1.1. SB_DFF - D Flip-Flop

| | Inputs | | Output | Key |
|----------------|--------|---|--------|----------------------|
| | D | С | Q | |
| | 0 | 1 | 0 | 1 – High logic level |
| | 1 | 1 | 1 | 0 – Low logic level |
| Power On State | Х | Х | 0 | X – Don't care |
| | | | | |

? - Unknown

HDL use

This register is inferred during synthesis and can also be explicitly instantiated.

Verilog Instantiation

// SB_DFF - D Flip-Flop.

VHDL Instantiation

```
-- SB_DFF - D Flip-Flop.
```

1.2. SB_DFFE -D Flip-Flop with Clock Enable

Data D is loaded into the flip-flop when Clock Enable E is high, during a rising clock edge transition.

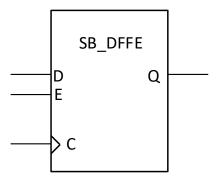

Figure 1.2. SB_DFFE -D Flip-Flop with Clock Enable

Table 1.2. SB_DFFE -D Flip-Flop with Clock Enable

| | Inputs | Output | Key | |
|----------------|--------|--------|------------|----------------------|
| E | D | С | Q | ✓ – Rising Edge |
| 0 | Х | Х | Previous Q | 1 – High logic level |
| 1 | 0 | 1 | 0 | 0 – Low logic level |
| 1 | 1 | 1 | 1 | X – Don't care |
| Power On State | Х | Х | 0 | ? – Unknown |

HDL Usage

This register is inferred during synthesis and can also be explicitly instantiated.

Default Signal Values

The iCEcube2 software assigns the following signal values to unconnected input ports:

Input D: Logic '0'
Input C: Logic '0'
Input E: Logic '1'

Note that explicitly connecting a logic '1' value to port E results in a non-optimal implementation, since an extra LUT is used to generate the logic '1'. It is recommended that the user leave the port E unconnected, or use the corresponding flip-flop without Enable functionality i.e. the DFF primitive.

Verilog Instantiation

// SB_DFFE - D Flip-Flop with Clock Enable.

VHDL Instantiation

-- SB_DFFE - D Flip-Flop with Clock Enable.

1.3. SB_DFFSR – D Flip-Flop with Synchronous Reset

Data: D is loaded into the flip-flop when Reset R is low during a rising clock edge transition.

Reset: R input is active high, overrides all other inputs and resets the Q output during a rising clock edge.

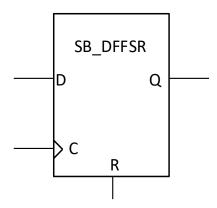

Figure 1.3. SB_DFFSR - D Flip-Flop with Synchronous Reset

Table 1.3. SB_DFFSR - D Flip-Flop with Synchronous Reset

| | Inputs | Output | | |
|----------------|--------|--------|------------|----------------------|
| R | D | С | Q | Key |
| 1 | Х | Х | Previous Q | ✓ – Rising Edge |
| Х | 0 | 1 | 0 | 1 – High logic level |
| 0 | 1 | 1 | 1 | 0 – Low logic level |
| 0 | X | X | 0 | X – Don't care |
| Power On State | | | | ? – Unknown |

HDL Usage

This register is inferred during synthesis and can also be explicitly instantiated.

Default Signal Values

The iCEcube2 software assigns the following signal values to unconnected input ports:

Input D: Logic '0'
Input C: Logic '0'
Input R: Logic '0'

Verilog Instantiation

// SB_DFFSR - D Flip-Flop, Reset is synchronous with the rising clock edge

© 2016-2021 Lattice Semiconductor Corp. All Lattice trademarks, registered trademarks, patents, and disclaimers are as listed at www.latticesemi.com/legal.

All other brand or product names are trademarks or registered trademarks of their respective holders. The specifications and information herein are subject to change without notice.

VHDL Instantiation

-- SB_DFFSR - D Flip-Flop, Reset is synchronous with the rising clock edge

1.4. SB DFFR – D Flip-Flop with Asynchronous Reset

Data: D is loaded into the flip-flop when R is low during a rising clock edge transition.

Reset: R input is active high, overrides all other inputs and asynchronously resets the Q output.

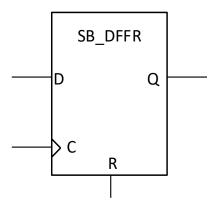

Figure 1.4. SB_DFFR - D Flip-Flop with Asynchronous Reset

Table 1.4. SB_DFFR - D Flip-Flop with Asynchronous Reset

| | Inputs | Output | Key | |
|----------------|--------|--------|-----|----------------------|
| R | D | С | Q | ✓ – Rising Edge |
| 1 | X | X | 0 | 1 – High logic level |
| 0 | 0 | 1 | 0 | 0 – Low logic level |
| 0 | 1 | 1 | 1 | X – Don't care |
| Power On State | X | X | 0 | ? – Unknown |

HDL Usage

This register is inferred during synthesis and can also be explicitly instantiated.

Default Signal Values

The iCEcube2 software assigns the following signal values to unconnected input ports:

Input D: Logic '0' Input C: Logic '0' Input R: Logic '0'

Verilog Instantiation

// SB_DFFR - D Flip-Flop, Reset is asynchronous to the clock.

VHDL Instantiation

-- SB_DFFR - D Flip-Flop, Reset is asynchronous to the clock.

1.5. SB_DFFSS – D Flip-Flop with Synchronous Set

Data: D is loaded into the flip-flop when the Synchronous Set S is low during a rising clock edge transition.

Set: S input is active high, overrides all other inputs and synchronously sets the Q output.

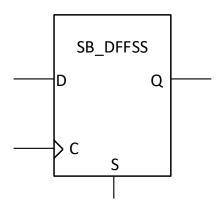

Figure 1.5. SB_DFFSS - D Flip-Flop with Synchronous Set

Table 1.5. SB_DFFSS - D Flip-Flop with Synchronous Set

| | Inputs | Output | Key | |
|----------------|--------|--------|-----|----------------------|
| S | D | С | Q | ✓ – Rising Edge |
| 1 | Х | 1 | 1 | 1 – High logic level |
| 0 | 0 | 1 | 0 | 0 – Low logic level |
| 0 | 1 | 1 | 1 | X – Don't care |
| Power On State | Х | Х | 0 | ? – Unknown |

1.6. SB_DFFS – D Flip-Flop with Asynchronous Set

Data: D is loaded into the flip-flop when S is low during a rising clock edge transition.

Set: S input is active high, and it overrides all other inputs and asynchronously sets the Q output.

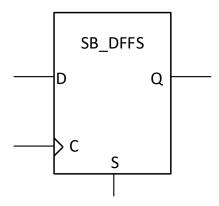

Figure 1.6. SB DFFS - D Flip-Flop with Asynchronous Set

Table 1.6. SB_DFFS - D Flip-Flop with Asynchronous Set

| Inputs | | | Output | Key |
|----------------|---|---|--------|----------------------|
| S | D | С | Q | ✓ – Rising Edge |
| 1 | Х | Х | 1 | 1 – High logic level |
| 0 | 0 | 1 | 0 | 0 – Low logic level |
| 0 | 1 | 1 | 1 | X – Don't care |
| Power On State | Х | Х | 0 | ? – Unknown |

HDL Usage

This register is inferred during synthesis and can also be explicitly instantiated.

Default Signal Values

The iCEcube2 software assigns the following signal values to unconnected input ports:

Input D: Logic '0'
Input C: Logic '0'
Input S: Logic '0'

Verilog Instantiation

// SB_DFFS - D Flip-Flop, Set is asynchronous to the rising clock edge

VHDL Instantiation

-- SB DFFS - D Flip-Flop, Set is asynchronous to the rising clock edge

1.8. SB_DFFER - D Flip-Flop with Clock Enable and Asynchronous Reset

Data: D is loaded into the flip-flop when Reset R is low and Clock Enable E is high during a rising clock edge transition. Reset: R, when asserted with Clock Enable E high, synchronously resets the Q output during a rising clock edge.

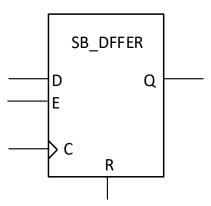

Figure 1.8. SB_DFFER - D Flip-Flop with Clock Enable and Asynchronous Reset

Table 1.8. SB_DFFER – D Flip-Flop with Clock Enable and Asynchronous Reset

| | | Inputs | Output | | | |
|---|----------------|--------|--------|---|-------------------|----------------------|
| | R | E | D | С | Q | Key |
| | 1 | Х | Х | Х | 0 | ✓ – Rising Edge |
| | 0 | 0 | Х | Х | Previous Q | 1 – High logic level |
| | 0 | 1 | 0 | 1 | 0 | 0 – Low logic level |
| | 0 | 1 | 1 | 1 | 1 | X – Don't care |
| F | Power On State | Х | Х | Х | 0 | ? – Unknown |

HDL Usage

This register is inferred during synthesis and can also be explicitly instantiated.

Default Signal Values

The iCEcube2 software assigns the following signal values to unconnected input ports:

Input D: Logic '0' Input C: Logic '0' Input R: Logic '0' Input E: Logic '1'

Note that explicitly connecting a Logic '1' value to port E results in a non-optimal implementation, since an extra LUT is used to generate the Logic '1'. If your intention is to keep the FF always enabled, it is recommended that either port E be left unconnected, or the corresponding FF primitive without a Clock Enable port be used.

Verilog Instantiation

| 1 | 1 | 1 | 1 | LUT_INIT[15] |

HDL Usage

This primitive is inferred during synthesis and can also be explicitly instantiated.

Default Signal Values

The iCEcube2 software assigns logic value '0' to unconnected input ports.

Verilog Instantiation

// SB_LUT4 : 4-input Look-Up Table

VHDL Instantiation

-- SB_LUT4: 4-input Look-Up Table.

2.2. SB_CARRY

Carry Logic

The dedicated Carry Logic within each Logic Cell primarily accelerates and improves the efficiency of arithmetic logic such as adders, accumulators, subtracters, incrementers, decrementers, counters, ALUs, and comparators. The Carry Logic also supports a limited number of wide combinational logic functions.

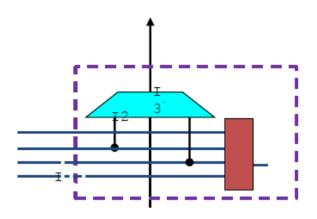

The figure below illustrates the Carry Logic structure within a Logic Cell. The Carry Logic shares inputs with the associated Look-Up Table (LUT). The I1 and I2 inputs of the LUT directly feed the Carry Logic. The carry input from the previous adjacent Logic Cell optionally provides an alternate input to the LUT4 function, supplanting the I3 input.

3. iCE40 Block RAM Primitives

The iCE40 architecture supports dual ported synchronous RAM, with 4096 bits, and a fixed 16-bit data width. The block is arranged as 256 × 16 bit words. The RAM block may be configured to be used as a RAM with data between 1-16 bits.

Each iCE40 device includes multiple high-speed synchronous RAM blocks, each 4 kbit in size. The RAM block has separate write and read ports, each with independent control signals. Each RAM block can be configured into a RAM block of size 256×16 , 512×8 , 1024×4 or 2048×2 . The data contents of the RAM block are optionally pre-loaded during ICE device configuration.

The following table lists the supported dual port synchronous RAM configurations, each of 4 kbits in size. The RAM blocks can be directly instantiated in the top module and taken through iCube2 flow.

Table 3.1. iCE40 Block RAM

| Block RAM Configuration | Block RAM Size | WADDR Port Size (Bits) | WDATA Port Size (Bits) | RADDR Port Size (Bits) | RDATA Port Size (Bits) | MASK Port Size (Bits) |
|--|-------------------|---------------------------|------------------------|------------------------------|------------------------------|--------------------------|
| SB_RAM256x16 SB_RAM256x16NR SB_RAM256x16NW SB_RAM256x16NRNW | 256x16 (4K) | 8 [7:0] | 16 [15:0] | 8 [7:0] | 16 [15:0] | 16 [15:0] |
| SB_RAM512x8 SB_RAM512x8NR SB_RAM512x8NW SB_RAM512x8NRNW | 512x8 (4K) | 9 [8:0] | 8 [7:0] | 8 [8:0] | 8 [7:0] | No Mask Port |
| SB_RAM1024x4 SB_RAM1024x4NR SB_RAM1024x4NW SB_RAM1024x4NRNW | 1024x4 (4K) | 10 [9:0] | 4 [3:0] | 10 [9:0] | 4 [3:0] | No Mask Port |
| SB_RAM2048x2 SB_RAM2048x2NR SB_RAM2048x2NW SB_RAM2048x2NRNW | 2048x2 (4K) | 11 [10:0] | 2 [1:0] | 10 [9:0] | 2 [1:0] | No Mask Port |

The Lattice Technologies convention for the iCE40 RAM primitives with negedge Read or Write clock is that the base primitive name is post fixed with N and R or W according to the clock that is affected, as displayed in the table below for 256×16 RAM block configuration.

Table 3.2. 256 × 16 RAM Block Configuration

| RAM Primitive Name | Description |
|--------------------|---|
| SB_RAM256x16 | Posedge Read clock, Posedge Write clock |
| SB_RAM4256x16NR | Negedge Read clock, Posedge Write clock |
| SB_RAM256x16NW | Posedge Read clock, Negedge Write clock |
| SB_RAM256x16NRNW | Negedge Read clock, Negedge Write clock |

3.5. SB_RAM40_4K

SB_RAM40_4K is the basic physical RAM primitive which can be instantiated and configured to different depth and dataports. The SB_RAM40_4K block has a size of 4 Kbits with separate write and read ports, each with independent control signals. By default, input and output data is 16 bits wide, although the data width is configurable using the READ_MODE and WRITE_MODE parameters. The data contents of the SB_RAM40_4K block are optionally pre-loaded during iCE device configuration.

Table 3.3. SB_RAM40_4K Naming Convention Rules

| RAM Primitive Name | Description | |
|--------------------|---|--|
| SB_RAM40_4K | Posedge Read clock, Posedge Write clock | |
| SB_RAM40_4KNR | Negedge Read clock, Posedge Write clock | |
| SB_RAM40_4KNW | Posedge Read clock, Negedge Write clock | |
| SB_RAM40_4KNRNW | Negedge Read clock, Negedge Write clock | |

SB_RAM256x16

Figure 3.5. SB_RAM40_4K

The following table lists the signals for both ports.

Table 3.4. SB_RAM40_4K RAM Port Signals

| Signal Name | Direction | Description |
|-------------|-----------|--|
| WDATA[15:0] | Input | Write Data input |
| MASK[15:0]* | Input | Bit-line Write Enable input, active low. Applicable only when WRITE_MODE parameter is set to 0. |
| WADDR[7:0] | Input | Write Address input. Selects up to 256 possible locations |
| WE | Input | Write Enable input, active high |
| WCLK | Input | Write Clock input, rising-edge active |
| WCLKE | Input | Write Clock Enable input |
| RDATA[15:0] | Output | Read Data output |
| RADDR[7:0] | Input | Read Address input. Selects one of 256 possible locations |
| RE | Input | Read Enable input, active high |
| RCLK | Input | Read Clock input, rising-edge active |
| RCLKE | Input | Read Clock Enable input |

Table 3.5. SB_RAM40_4K RAM Parameters

| Parameter Name | Description | Parameter Value | Configuration |
|--------------------|--|---------------------|--|
| INIT_0, ,INIT_F | RAM Initialization Data. Passed using 16 parameter strings, each comprising 256 bits. (16 × 256 = 4096 total bits) | INIT_0 to INIT_F | Initialize the RAM with predefined value |
| WRITE_MODE | Sets the RAM block write port | 0 | 256x16 |
| | configuration | 1 | 512x8 |
| | | 2 | 1024x4 |
| | | 3 | 2048x2 |
| READ_MODE | Sets the RAM block read port | 0 | 256x16 |
| | configuration | 1 | 512x8 |
| | | 2 | 1024x4 |
| | | 3 | 2048x2 |

      );
```

4. I/O Primitives

4.1. SB_IO

The SB_IO block contains five registers. The following figure and Verilog template illustrate the complete user accessible logic diagram, and its Verilog instantiation.

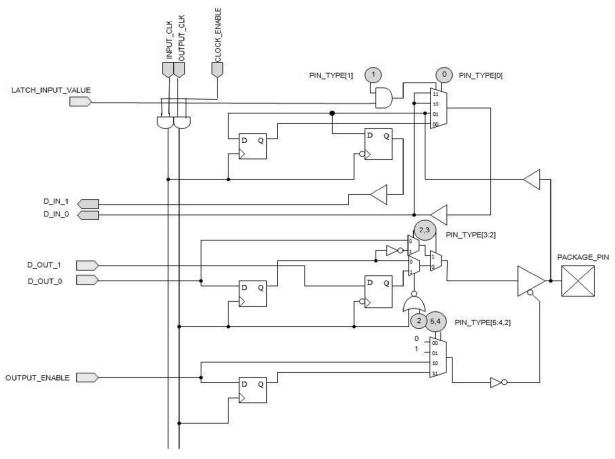

Figure 4.1. SB_IO

Default Signal Values

The iCEcube2 software assigns the logic '0' value to all unconnected input ports except for CLOCK ENABLE.

Note that explicitly connecting a logic '1' value to port CLOCK_ENABLE results in a non-optimal implementation, since an extra LUT is used to generate the Logic '1'. If your intention is to keep the Input and Output registers always enabled, it is recommended that port CLOCK_ENABLE be left unconnected.

Input and Output Pin Function Tables

Input and Output functions are independently selectable through the PIN_TYPE [1:0] and PIN_TYPE [5:2] parameter settings respectively. Specific I/O functions are defined by the combination of both attributes. This means that the complete number of combinations is 64, although some combinations are not valid and not defined below.

Note that the selection of I/O Standards such as SSTL and LVCMOS are not defined by these tables.

Table 4.1. Input Pin Function

| # | Pin Function Mnemonic | PIN_TYPE[1:0] | | Functional Description of Package Pin Input Operation |
|---|----------------------------|---------------|---|--|
| 1 | PIN_INPUT | 0 | 1 | Simple input pin (D_IN_0) |
| 2 | PIN_INPUT_LATCH | 1 | 1 | Disables internal data changes on the physical input pin by latching the value. |
| 3 | PIN_INPUT_REGISTERED | 0 | 0 | Input data is registered in input cell. |
| 4 | PIN_INPUT_REGISTERED_LATCH | 1 | 0 | Disables internal data changes on the physical input pin by latching the value on the input register. |
| 5 | PIN_INPUT_DDR | 0 | 0 | Input 'DDR' data is clocked out on rising and falling clock edges. Use the D_IN_0 and D_IN_1 pins for DDR operation. |

Table 4.2. Output Pin Function

| # | Pin Function Mnemonic | nonic PIN TYPE[5:2] | | | 21 | Functional Description of Package Pin Output Operation |
|----|--|---------------------|---|---|----|--|
| 1 | PIN_NO_OUTPUT | 0 | 0 | 0 | 0 | Disables the output function |
| 2 | PIN_OUTPUT | 0 | 1 | 1 | 0 | Simple output pin, (no enable) |
| 3 | PIN_OUTPUT_TRISTATE | 1 | 0 | 1 | 0 | The output pin may be tristated using the enable |
| 4 | PIN_OUTPUT_ENABLE_REGISTERED | 1 | 1 | 1 | 0 | The output pin may be tristated using a registered enable signal |
| 5 | PIN_OUTPUT_REGISTERED | 0 | 1 | 0 | 1 | Output registered, (no enable) |
| 6 | PIN_OUTPUT_REGISTERED_ENABLE | 1 | 0 | 0 | 1 | Output registered with enable (enable is not registered) |
| 7 | PIN_OUTPUT_REGISTERED_ENABLE_ REGISTERED | 1 | 1 | 0 | 1 | Output registered and enable registered |
| 8 | PIN_OUTPUT_DDR | 0 | 1 | 0 | 0 | Output 'DDR' data is clocked out on rising and falling clock edges |
| 9 | PIN_OUTPUT_DDR_ENABLE | 1 | 0 | 0 | 0 | Output data is clocked out on rising and falling clock edges |
| 10 | PIN_OUTPUT_DDR_ENABLE_ REGISTERED | 1 | 1 | 0 | 0 | Output 'DDR' data with registered enable signal |
| 11 | PIN_OUTPUT_REGISTERED_INVERTE D | 0 | 1 | 1 | 1 | Output registered signal is inverted |
| 12 | PIN_OUTPUT_REGISTERED_ENABLE INVERTED | 1 | 0 | 1 | 1 | Output signal is registered and inverted, (no enable function) |
| 13 | PIN_OUTPUT_REGISTERED_ENABLE_ REGISTERED_INVERTED | 1 | 1 | 1 | 1 | Output signal is registered and inverted, the enable/tristate control is registered. |

Syntax Verilog Use

Output Pin Function is the bit vector associated with PIN_TYPE [5:2] and Input Pin Function is the bit vector associated with PIN_TYPE [1:0], resulting in a 6-bit value PIN_TYPE [5:0]

defparam my_generic_IO.PIN_TYPE = 6'b{Output Pin Function, Input Pin Function};

4.1.1. DDR I/O Configuration

The following setting configures the SB_IO into a DDR I/O.

```
defparam my_DDR_IO.PIN_TYPE = 6'b100000;

// PIN_TYPE [5:2] = 1000

// PIN_TYPE [1:0] = 00
```

This creates a DDR I/O pin whereby the input data is clocked in on both the rising and falling input clock edges.

The output 'DDR' data is clocked out on rising and falling output clock edges, and the output may be tri-stated, using the output enable port of the SB_IO.

4.1.2. High Drive SB_IO

I/O in iCE40/iCE40LM device can be configured with different drive strengths to increase the I/O output current. To configure an SB_IO with specific drive value, the user needs to specify the "DRIVE_STRENGTH" synthesis attribute on the SB_IO instance and the I/O should be configured as output-only registered I/O.

Synthesis Attribute Syntax:

```
/* synthesis DRIVE STRENGTH = <Drive value> */
```

Table 4.3. Drive Value

| Drive Strength Value | Description | |
|----------------------|---|--|
| x1 | Default drive strength. No replication of SB_IO. | |
| x2 | Increase default drive strength by 2. SB_IO replicated once. | |
| хЗ | Increase default drive strength by 3. SB_IO replicated twice. | |

Note: High drive SB_IO is available only in selected iCE40/iCE40LM packages. Refer to Chapter 12 in iCEcube2 userguide for the list of supported device packages.

4.1.3. Pull Up Resistor Configuration

For iCE40UL device, you can configure the internal pull-up resistor strength of an I/O to a predefined resistor value through the attribute settings. By default, all the I/O are weakly pulled up by 100k internal resistor.

The PULLUP_RESISTOR attribute is effective only when PULLUP parameter is set to 1.

Synthesis Attribute Syntax:

```
/* synthesis PULLUP_RESISTOR = "3P3K" */
```

Table 4.4. Pull-up Resistor Value

| Drive Strength Value | Description | |
|----------------------|---|--|
| "3P3K" | Pull-up resistor level is 3.3k. | |
| "6P8K" | Pull-up resistor level is 6.8k. | |
| "10K" | Pull-up resistor level is 10k. | |
| "100K" | Pull-up resistor level is 100k (default). | |

Note: PULLUP RESISTOR attribute is supported only for iCE40UL devices.

Verilog Instantiation

```
SB GB IO My Clock Buffer Package Pin ( // A users external Clock reference
pin
                                // User's Pin signal name
.PACKAGE PIN (Package Pin),
.LATCH_INPUT_VALUE (latch_input_value), // Latches/holds the Input value
                                     // Clock Enable common to input and
.CLOCK ENABLE (clock enable),
// output clock
.INPUT_CLK (input_clk), // Clock for the input registers
.OUTPUT CLK (output clk), // Clock for the output registers
.OUTPUT ENABLE (output_enable), // Output Pin Tristate/Enable
     // control
.D OUT 0 (d out 0), // Data 0 - out to Pin/Rising clk
     //
          edge
.D OUT 1 (d out_1),
                     // Data 1 - out to Pin/Falling clk
     //
          edge
.D IN 0 (d in 0), // Data 0 - Pin input/Rising clk
     // edge
.D IN 1 (d in 1) // Data 1 - Pin input/Falling clk
     // edge
.GLOBAL BUFFER OUTPUT (Global Buffered User Clock)
// Example use - clock buffer
//driven from the input pin
);
defparam My Clock Buffer Package Pin.PIN TYPE = 6'b000000;
// See Input and Output Pin Function Tables.
// Default value of PIN TYPE = 6'000000 i.e.
// an input pad, with the input signal
// registered
```

Note: This primitive is a superset of the SB_IO primitive, and includes the connectivity to drive a Global Buffer. For example SB_GB_IO pins are likely to be used for external Clocks.

5.2. SB_GB Primitive

Figure 5.2. SB_GB Primitive

Verilog Instantiation

```
SB_GB My_Global_Buffer_i ( //Required for a user's internally generated //FPGA signal that is heavily loaded and //requires global buffering. For example, a //user's logic-generated clock.

.USER_SIGNAL_TO_GLOBAL_BUFFER (Users_internal_Clk),
.GLOBAL_BUFFER_OUTPUT ( Global_Buffered_User_Signal)

);
```

6. PLL Primitives

There are five primitives that represent the PLL function in the iCEcube2 software viz. SB_PLL40_CORE, SB_PLL40_PAD, SB_PLL40_2 PAD, SB_PLL40_2 PAD, SB_PLL40_2 PAD for the iCE40 device family. A short description of each primitive and its ports/parameters is provided in the following sections.

It is strongly recommended that the configuration of the PLL primitives be accomplished through the use of the PLL Configuration tool that is offered as part of the iCEcube2 software.

6.1. SB_PLL40_CORE

The SB_PLL40_CORE primitive should be used when the source clock of the PLL is driven by FPGA routing, that is, when the PLL source clock originates on the FPGA or is driven by an input pad that is not in the bottom I/O bank (I/O Bank 2).

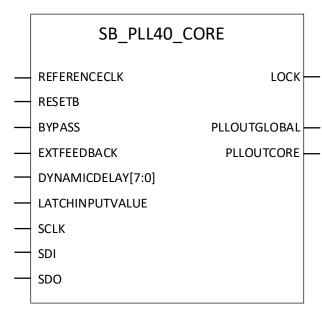

Figure 6.1. SB_PLL40_CORE

Ports

REFERENCECLK: PLL source clock that serves as the input to the SB PLL40 CORE primitive.

PLLOUTGLOBAL: Output clock generated by the PLL, drives a global clock network on the FPGA.

PLLOUTCORE: Output clock generated by the PLL, drives regular FPGA routing. The frequency generated on this output is the same as the frequency of the clock signal generated on the PLLOUTLGOBAL port.

LOCK: Output port, when HIGH, indicates that the signal on PLLOUTGLOBAL/PLLOUTCORE is locked to the PLL source on REFERENCECLK.

EXTFEEDBACK: External feedback input to PLL. Enabled when the FEEDBACK_PATH parameter is set to EXTERNAL.

DYNAMICDELAY: 7-bit input bus that enables dynamic control of the delay contributed by the Fine Delay Adjust Block. The Fine Delay Adjust Block is used when there is a need to adjust the phase alignment of

PLLOUTGLOBAL/PLLOUTCORE with respect to REFERENCECLK. The DYNAMICDELAY port controls are enabled when the DELAY_ADJUSTMENT_MODE parameter is set to DYNAMIC.

RESETB: Active low input that asynchronously resets the PLL.

BYPASS: Input signal, when asserted, connects the signal on REFERENCECLK to PLLOUTCORE/PLLOUTGLOBAL pins.

LATCHINPUTVALUE: Active high input, when enabled, forces the PLL into low-power mode. The PLLOUTGLOBAL/PLLOUTCORE pins are held static at their last value. This function is enabled when the parameter ENABLE_ICEGATE is set to '1'.

SCLK, SDI, SDO: These pins are used only for internal testing purposes, and need not be instantiated by users.

Parameters

The SB_PLL40_CORE primitive requires configuration through the specification of the following parameters. It is strongly recommended that the configuration of the PLL primitives be accomplished through the use of the PLL Configuration tool that is offered as part of the iCEcube2 software.

Table 6.1. SB_PLL40_CORE Parameters

| Parameter Name | Description | Parameter Value | Description |
|------------------------------------|--|-----------------|--|
| FEEDBACK_PATH | Selects the feedback path to the PLL | SIMPLE | Feedback is internal to the PLL, directly from VCO |
| | | DELAY | Feedback is internal to the PLL, through the Fine Delay Adjust Block |
| | | PHASE_AND_DELAY | Feedback is internal to the PLL, through the Phase Shifter and the Fine Delay Adjust Block |
| | | EXTERNAL | Feedback path is external to the PLL, and connects to EXTFEEDBACK pin. Also uses the Fine Delay Adjust Block. |
| DELAY_ADJUSTMENT_MODE _FEEDBACK | Selects the mode for the Fine Delay Adjust block in the feedback path | FIXED | Delay of the Fine Delay Adjust Block is fixed, the value is specified by the FDA_FEEDBACK parameter setting |
| | | DYNAMIC | Delay of Fine Delay Adjust Block is determined by the signal value at the DYNAMICDELAY[3:0] pins |
| FDA_FEEDBACK | Sets a constant value for the Fine Delay Adjust Block in the feedback path | 0, 1,,15 | The PLLOUTGLOBAL and PLLOUTCORE signals are delay compensated by (n+1)×150 ps, where n = FDA_FEEDBACK only if the setting of the DELAY_ADJUSTMENT_MODE_F EEDBACK is FIXED. |
| DELAY_ADJUSTMENT_MODE _RELATIVE | Selects the mode for the Fine Delay Adjust block | FIXED | Delay of the Fine Delay Adjust Block is fixed, the value is specified by the FDA_RELATIVE parameter setting |
| | | DYNAMIC | Delay of Fine Delay Adjust Block is determined by the signal value at the DYNAMICDELAY[7:4] pins |
| FDA_RELATIVE | Sets a constant value for the Fine Delay Adjust Block | 0, 1,,15 | The PLLOUTGLOBALA and PLLOUTCOREA signals are additionally delayed by (n+1)×150 ps, where n = FDA_RELATIVE. Used if DELAY_ADJUSTMENT_MODE_ RELATIVE is "FIXED". |
| SHIFTREG_DIV_MODE | Selects shift register configuration | 0,1 | Used when FEEDBACK_PATH is "PHASE_AND_DELAY". 0-> Divide by 4 1-> Divide by 7 |

| Parameter Name | Description | Parameter Value | Description |
|-------------------------|--|------------------------------------|---|
| PLLOUT_SELECT | Selects the signal to be output at the PLLOUTCORE and PLLOUTGLOBAL ports | SHIFTREG_Odeg | 00 phase shift only if the setting of FEEDBACK_PATH is "PHASE_AND_DELAY" |
| | | SHIFTREG_90deg | 90° phase shift only if the setting of FEEDBACK_PATH is "PHASE_AND_DELAY" and SHIFTREG_DIV_MODE=0 |
| | | GENCLK | The internally generated PLL frequency outputs without any phase shift. |
| | | GENCLK_HALF | The internally generated PLL frequency is divided by 2 and then output. No phase shift. |
| DIVR | REFERENCECLK divider | 0,1,2,,15 | These parameters are used to |
| DIVF | Feedback divider | 0,1,,63 | control the output frequency, |
| DIVQ | VCO Divider | 1,2,,6 | depending on the FEEDBACK_PATH setting. |
| FILTER_RANGE | PLL Filter Range | 0,1,,7 | Setting. |
| EXTERNAL_DIVIDE_FACT OR | Divide-by factor of a divider in external feedback path | User-specified value. Default 1 | Specified only when there is a user- implemented divider in the external feedback path. |
| ENABLE_ICEGATE | Enables the PLL power- | 0 | Power-down control disabled |
| | down control | 1 | Power-down controlled by LATCHINPUTVALUE input |

6.2. SB_PLL40_PAD

The SB_PLL40_PAD primitive should be used when the source clock of the PLL is driven by an input pad that is located in the bottom I/O bank (I/O Bank 2) or the top I/O bank (I/O Bank 0), and the source clock is not required inside the FPGA.

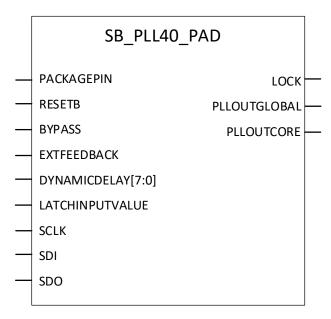

Figure 6.2. SB_PLL40_PAD

Ports

PACKAGEPIN: PLL REFERENCE CLOCK pin that serves as the input to the SB_PLL40_PAD primitive.

PLLOUTGLOBAL: Output clock generated by the PLL, drives a global clock network on the FPGA.

PLLOUTCORE: Output clock generated by the PLL, drives regular FPGA routing. The frequency generated on this output is the same as the frequency of the clock signal generated on the PLLOUTLGOBAL port.

LOCK: Output port, when HIGH, indicates that the signal on PLLOUTGLOBAL/PLLOUTCORE is locked to the PLL source on PACKAGEPIN.

EXTFEEDBACK: External feedback input to PLL. Enabled when the FEEDBACK PATH parameter is set to EXTERNAL.

DYNAMICDELAY: 7-bit input bus that enables dynamic control of the delay contributed by the Fine Delay Adjust Block. The Fine Delay Adjust Block is used when there is a need to adjust the phase alignment of PLLOUTGLOBAL/PLLOUTCORE with respect to PACKAGEPIN. The DYNAMICDELAY port controls are enabled when the DELAY_ADJUSTMENT_MODE parameter is set to DYNAMIC.

RESETB: Active low input that asynchronously resets the PLL.

BYPASS: Input signal, when asserted, connects the signal on PACKAGEPIN to

PLLOUTCORE/PLLOUTGLOBAL pins.

LATCHINPUTVALUE: Active high input, when enabled, forces the PLL into low-power mode. The PLLOUTGLOBAL/PLLOUTCORE pins are held static at their last value. This function is enabled when the parameter ENABLE ICEGATE is set to '1'.

SCLK, SDI, SDO: These pins are used only for internal testing purposes, and need not be instantiated by users.

Parameters

The SB_PLL40_PAD primitive requires configuration through the specification of the following parameters. It is strongly recommended that the configuration of the PLL primitives be accomplished through the use of the PLL Configuration tool that is offered as part of the iCEcube2 software.

Table 6.2. SB_PLL40_PAD Parameters

| Parameter Name | Description | Parameter Value | Description |
|---------------------------------|---|-----------------|---|
| FEEDBACK_PATH | Selects the feedback path to the PLL | SIMPLE | Feedback is internal to the PLL, directly from VCO |
| | | DELAY | Feedback is internal to the PLL, through the Fine Delay Adjust Block |
| | | PHASE_AND_DELAY | Feedback is internal to the PLL, through the Phase Shifter and the Fine Delay Adjust Block |
| | | EXTERNAL | Feedback path is external to the PLL, and connects to EXTFEEDBACK pin. Also uses the Fine Delay Adjust Block. |
| DELAY_ADJUSTMENT_MO DE_FEEDBACK | Selects the mode for the Fine Delay Adjust block in the feedback path | FIXED | Delay of the Fine Delay Adjust Block is fixed, the value is specified by the FDA_FEEDBACK parameter setting |
| | | DYNAMIC | Delay of Fine Delay Adjust Block is determined by the signal value at the DYNAMICDELAY [3:0] pins |

| Parameter Name | Description | Parameter Value | Description |
|---------------------------------|--|------------------------------------|---|
| FDA_FEEDBACK | Sets a constant value for the Fine Delay Adjust Block in the feedback path | 0, 1,,15 | The PLLOUTGLOBAL and PLLOUTCORE signals are delay compensated by (n+1) ×150 ps, where n = FDA_FEEDBACK only if the setting of the DELAY_ADJUSTMENT_MODE_F EEDBACK is FIXED. |
| DELAY_ADJUSTMENT_MO DE_RELATIVE | Selects the mode for the Fine Delay Adjust block | FIXED | Delay of the Fine Delay Adjust Block is fixed, the value is specified by the FDA_RELATIVE parameter setting |
| | | DYNAMIC | Delay of Fine Delay Adjust Block is determined by the signal value at the DYNAMICDELAY[7:4] pins |
| FDA_RELATIVE | Sets a constant value for the Fine Delay Adjust Block | 0, 1,,15 | The PLLOUTGLOBALA and PLLOUTCOREA signals are additionally delayed by (n+1)×150 ps, where n = FDA_RELATIVE. Used if DELAY_ADJUSTMENT_MODE_ RELATIVE is "FIXED". |
| SHIFTREG_DIV_MODE | Selects shift register configuration | 0,1 | Used when FEEDBACK_PATH is "PHASE_AND_DELAY". 0 -> Divide by 4 1 -> Divide by 7 |
| PLLOUT_SELECT | Selects the signal to be output at the PLLOUTCORE and PLLOUTGLOBAL ports | SHIFTREG_Odeg | Oo phase shift only if the setting of FEEDBACK_PATH is "PHASE_AND_DELAY" |
| | | SHIFTREG_90deg | 90° phase shift only if the setting of FEEDBACK_PATH is "PHASE_AND_DELAY" and SHIFTREG_DIV_MODE=0 |
| | | GENCLK | The internally generated PLL frequency outputs without any phase shift. |
| | | GENCLK_HALF | The internally generated PLL frequency is divided by 2 and then output. No phase shift. |
| DIVR | REFERENCECLK divider | 0,1,2,,15 | These parameters are used to |
| DIVF | Feedback divider | 0,1,,63 | control the output frequency, depending on the FEEDBACK_PATH setting. |
| DIVQ | VCO Divider | 1,2,,6 | |
| FILTER_RANGE | PLL Filter Range | 0,1,,7 | |
| EXTERNAL_DIVIDE_FACT OR | Divide-by factor of a divider in external feedback path | User-specified value. Default 1 | Specified only when there is a user- implemented divider in the external feedback path. |
| ENABLE_ICEGATE | Enables the PLL power- | 0 | Power-down control disabled |
| | down control | 1 | Power-down controlled by LATCHINPUTVALUE input |
| DIVF | Feedback divider | 0,1,,63 | Control the output frequency, depending on the FEEDBACK_PATH setting. |
| DIVQ | VCO Divider | 1,2,,6 | |

| Parameter Name | Description | Parameter Value | Description |
|-------------------------|---|------------------------------------|---|
| FILTER_RANGE | PLL Filter Range | 0,1,,7 | |
| EXTERNAL_DIVIDE_FACT OR | Divide-by factor of a divider in external feedback path | User-specified value. Default 1 | Specified only when there is a user- implemented divider in the external feedback path. |
| ENABLE_ICEGATE | Enables the PLL power- | 0 | Power-down control disabled |
| | down control | 1 | Power-down controlled by LATCHINPUTVALUE input |

6.3. SB_PLL40_2_PAD

The SB_PLL40_2_PAD primitive should be used when the source clock of the PLL is driven by an input pad that is located in the bottom I/O bank (I/O Bank 2) or the top I/O bank (I/O Bank 0), and in addition to the PLL output, the source clock is also required inside the FPGA.

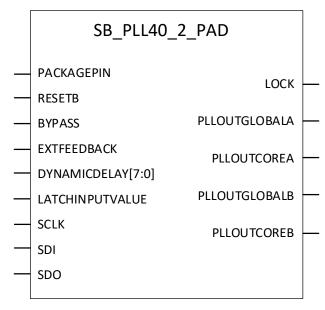

Figure 6.3. SB_PLL40_2_PAD

Ports

PACKAGEPIN: PLL REFERENCE CLOCK pin that serves as the input to the SB PLL40 2 PAD primitive.

PLLOUTGLOBALA: The signal on PACKAGEPIN appears on the FPGA at this pin, and drives a global clock network on the FPGA. Do not use this pin in an external feedback path to the PLL.

PLLOUTCOREA: The signal on PACKAGEPIN appears on the FPGA at this pin, which drives regular

FPGA routing. Do not use this pin in an external feedback path to the PLL.

PLLOUTGLOBALB: Output clock generated by the PLL, drives a global clock network on the FPGA.

PLLOUTCOREB: Output clock generated by the PLL, drives regular FPGA routing. The frequency generated on this output is the same as the frequency of the clock signal generated on the PLLOUTLGOBAL port.

LOCK: Output port, when HIGH, indicates that the signal on PLLOUTGLOBALB/PLLOUTCOREB is locked to the PLL source on PACKAGEPIN.

EXTFEEDBACK: External feedback input to PLL. Enabled when the FEEDBACK PATH parameter is set to EXTERNAL.

DYNAMICDELAY: 4-bit input bus that enables dynamic control of the delay contributed by the Fine Delay Adjust Block.

The Fine Delay Adjust Block is used when there is a need to adjust the phase alignment of

PLLOUTGLOBAL/PLLOUTCORE with respect to PACKAGEPIN. The DYNAMICDELAY port controls are enabled when the DELAY ADJUSTMENT MODE parameter is set to DYNAMIC.

All other brand or product names are trademarks or registered trademarks of their respective holders. The specifications and information herein are subject to change without notice.

RESET: Active low input that asynchronously resets the PLL.

BYPASS: Input signal, when asserted, connects the signal on PACKAGEPIN to

PLLOUTCORE/PLLOUTGLOBAL pins.

LATCHINPUTVALUE: Active high input, when enabled, forces the PLL into low-power mode. The PLLOUTGLOBALA/PLLOUTCOREA pins are held static at their last value only when the parameter ENABLE_ICEGATE_PORTA is set to '1', and the LATCHINPUTVALUE signal is asserted. The PLLOUTGLOBALB/PLLOUTCOREB pins are held static at their last value only when the parameter ENABLE_ICEGATE_PORTB is set to '1', and the LATCHINPUTVALUE signal is asserted.

SCLK, SDI, SDO: These pins are used only for internal testing purposes, and need not be instantiated by users.

Parameters

The SB_PLL40_2_PAD primitive requires configuration through the specification of the following parameters. It is strongly recommended that the configuration of the PLL primitives be accomplished through the use of the PLL Configuration tool that is offered as part of the iCEcube2 software.

Table 6.3. SB_PLL40_2_PAD Parameters

| Parameter Name | Description | Parameter Value | Description |
|------------------------------------|--|-----------------|---|
| FEEDBACK_PATH | Selects the feedback path to the PLL | SIMPLE | Feedback is internal to the PLL, directly from VCO |
| | | DELAY | Feedback is internal to the PLL, through the Fine Delay Adjust Block |
| | | PHASE_AND_DELAY | Feedback is internal to the PLL, through the Phase Shifter and the Fine Delay Adjust Block |
| | | EXTERNAL | Feedback path is external to the PLL, and connects to EXTFEEDBACK pin. Also uses the Fine Delay Adjust Block. |
| DELAY_ADJUSTMENT_MODE _FEEDBACK | Selects the mode for the Fine Delay Adjust block in the feedback path | FIXED | Delay of the Fine Delay Adjust Block is fixed, the value is specified by the FDA_FEEDBACK parameter setting |
| | | DYNAMIC | Delay of Fine Delay Adjust Block is determined by the signal value at the DYNAMICDELAY[3:0] pins |
| FDA_FEEDBACK | Sets a constant value for the Fine Delay Adjust Block in the feedback path | 0, 1,,15 | The PLLOUTGLOBAL and PLLOUTCORE signals are delay compensated by (n+1)×150 ps, where n = FDA_FEEDBACK only if the setting of the DELAY_ADJUSTMENT_MODE_FEEDBACK is FIXED. |

| Parameter Name | Description | Parameter Value | Description |
|---------------------------------|--|---------------------------------|--|
| DELAY_ADJUSTMENT_MODE _RELATIVE | Selects the mode for the Fine Delay Adjust block | FIXED | Delay of the Fine Delay Adjust Block is fixed, the value is specified by the FDA_RELATIVE parameter setting |
| | | DYNAMIC | Delay of Fine Delay Adjust Block is determined by the signal value at the DYNAMICDELAY[7:4] pins |
| FDA_RELATIVE | Sets a constant value for the Fine Delay Adjust Block | 0, 1,,15 | The PLLOUTGLOBALA and PLLOUTCOREA signals are delayed w.r.t. the Port B signals, by (n+1)×150 ps, where n = FDA_RELATIVE. Used if DELAY_ADJUSTMENT_MODE_RELATIVE is "FIXED". |
| SHIFTREG_DIV_MODE | Selects shift register configuration | 0,1 | Used when FEEDBACK_PATH is "PHASE_AND_DELAY". 0 -> Divide by 4 1-> Divide by 7 |
| PLLOUT_SELECT_PORTB | Selects the signal to be output at the PLLOUTCOREB and PLLOUTGLOBALB ports | SHIFTREG_0deg | 0° phase shift only if the setting of FEEDBACK_PATH is "PHASE_AND_DELAY" |
| | | SHIFTREG_90deg | 90° phase shift only if the setting of FEEDBACK_PATH is "PHASE_AND_DELAY" and SHIFTREG_DIV_MODE=0 |
| | | GENCLK | The internally generated PLL frequency outputs to PortB. No phase shift. |
| | | GENCLK_HALF | The internally generated PLL frequency is divided by 2 and then output to PORTB. No phase shift. |
| DIVR | REFERENCECLK divider | 0,1,2,,15 | These parameters are used to |
| DIVF | Feedback divider | 0,1,,63 | control the output frequency, |
| DIVQ | VCO Divider | 1,2,,6 | depending on the |
| FILTER_RANGE | PLL Filter Range | 0,1,,7 | FEEDBACK_PATH setting. |
| EXTERNAL_DIVIDE_FACTOR | Divide-by factor of a divider in external feedback path | User-specified value. Default 1 | Specified only when there is a user-implemented divider in the external feedback path. |
| ENABLE_ICEGATE_PORTA | Enables the PLL power- down | 0 | Power-down control disabled |
| | control | 1 | Power-down controlled by LATCHINPUTVALUE input |
| ENABLE_ICEGATE_PORTB | Enables the PLL power- | 0 | Power-down control disabled |
| | down control | 1 | Power-down controlled by LATCHINPUTVALUE input |

6.4. SB_PLL40_2F_CORE

The SB_PLL40_2F_CORE primitive should be used when PLL is used to generate two different output frequencies, and the source clock of the PLL is driven by FPGA routing. For example, when the PLL source clock originates on the FPGA.

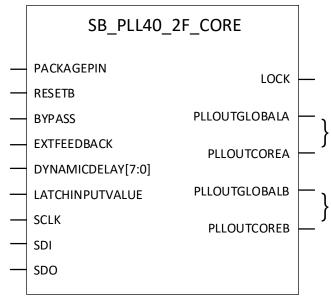

Figure 6.4. SB_PLL40_2F_CORE

Ports

REFERENCECLK: PLL source clock that serves as the input to the SB_PLL40_2F_CORE primitive.

PLLOUTGLOBALA: Output clock generated by the PLL, drives a global clock network on the FPGA.

PLLOUTCOREA: Output clock generated by the PLL, drives regular FPGA routing. The frequency generated on this output is the same as the frequency of the clock signal generated on the PLLOUTLGOBALA port.

PLLOUTGLOBALB: Output clock generated by the PLL, drives a global clock network on the FPGA.

PLLOUTCOREB: Output clock generated by the PLL, drives regular FPGA routing. The frequency generated on this output is the same as the frequency of the clock signal generated on the PLLOUTLGOBALB port.

LOCK: Output port, when HIGH, indicates that the signal on PLLOUTGLOBALB/PLLOUTCOREB is locked to the PLL source on PACKAGEPIN.

EXTFEEDBACK: External feedback input to PLL. Enabled when the FEEDBACK PATH parameter is set to EXTERNAL.

DYNAMICDELAY: 4-bit input bus that enables dynamic control of the delay contributed by the Fine Delay Adjust Block. The Fine Delay Adjust Block is used when there is a need to adjust the phase alignment of

PLLOUTGLOBAL/PLLOUTCORE with respect to REFERENCECLK. The DYNAMICDELAY port controls are enabled when the DELAY ADJUSTMENT MODE parameter is set to DYNAMIC.

RESETB: Active low input that asynchronously resets the PLL.

BYPASS: Input signal, when asserted, connects the signal on REFERENCECLK to

PLLOUTCORE/PLLOUTGLOBAL pins.

LATCHINPUTVALUE: Active high input, when enabled, forces the PLL into low-power mode. The PLLOUTGLOBALA/PLLOUTCOREA pins are held static at their last value only when the parameter ENABLE_ICEGATE_PORTA is set to '1', and the LATCHINPUTVALUE signal is asserted. The PLLOUTGLOBALB/PLLOUTCOREB pins are held static at their last value only when the parameter ENABLE_ICEGATE_PORTB is set to '1', and the LATCHINPUTVALUE signal is asserted.

SCLK, SDI, SDO: These pins are used only for internal testing purposes, and need not be instantiated by users.

Parameters

The SB_PLL40_2F_CORE primitive requires configuration through the specification of the following parameters. It is strongly recommended that the configuration of the PLL primitives be accomplished through the use of the PLL Configuration tool that is offered as part of the iCEcube2 software.

Table 6.4. SB_PLL40_2F_CORE Parameters

| Parameter Name | Description | Parameter Value | Description |
|------------------------------------|--|-----------------|---|
| FEEDBACK_PATH | Selects the feedback path to the PLL | SIMPLE | Feedback is internal to the PLL, directly from VCO |
| | | DELAY | Feedback is internal to the PLL, through the Fine Delay Adjust Block |
| | | PHASE_AND_DELAY | Feedback is internal to the PLL, through the Phase Shifter and the Fine Delay Adjust Block |
| | | EXTERNAL | Feedback path is external to the PLL, and connects to EXTFEEDBACK pin. Also uses the Fine Delay Adjust Block. |
| DELAY_ADJUSTMENT_MODE _FEEDBACK | Selects the mode for the Fine Delay Adjust block in the feedback path | FIXED | Delay of the Fine Delay Adjust Block is fixed, the value is specified by the FDA_FEEDBACK parameter setting |
| | | DYNAMIC | Delay of Fine Delay Adjust Block is determined by the signal value at the DYNAMICDELAY[3:0] pins |
| FDA_FEEDBACK | Sets a constant value for the Fine Delay Adjust Block in the feedback path | 0, 1,,15 | The PLLOUTGLOBALA and PLLOUTCOREA signals are delay compensated by (n+1)×150 ps, where n = FDA_FEEDBACK only if the setting of the DELAY_ADJUSTMENT_MODE_FEEDBACK is FIXED. |
| DELAY_ADJUSTMENT_MODE _RELATIVE | Selects the mode for the Fine Delay Adjust block | FIXED | Delay of the Fine Delay Adjust Block is fixed, the value is specified by the FDA_RELATIVE parameter setting |
| | | DYNAMIC | Delay of Fine Delay Adjust Block is determined by the signal value at the DYNAMICDELAY[7:4] pins |
| FDA_RELATIVE | Sets a constant value for the Fine Delay Adjust Block | 0, 1,,15 | The PLLOUTGLOBALA and PLLOUTCOREA signals are delayed w.r.t. the Port B signals, by (n+1)×150 ps, where n = FDA_RELATIVE. Used if DELAY_ADJUSTMENT_MODE_ RELATIVE is "FIXED". |
| SHIFTREG_DIV_MODE | Selects shift register configuration | 0,1 | Used when FEEDBACK_PATH is "PHASE_AND_DELAY". 0-> Divide by 4 1-> Divide by 7 |

| Parameter Name | Description | Parameter Value | Description |
|------------------------|---|------------------------------------|--|
| PLLOUT_SELECT_PORTA | Selects the signal to be output at the PLLOUTCOREA and | SHIFTREG_0deg | Oo phase shift only if the setting of FEEDBACK_PATH is "PHASE_AND_DELAY" |
| | PLLOUTGLOBALA ports | SHIFTREG_90deg | 90° phase shift only if the setting of FEEDBACK_PATH is "PHASE_AND_DELAY" and SHIFTREG_DIV_MODE=0 |
| | | GENCLK | The internally generated PLL frequency outputs to PortA. No phase shift. |
| | | GENCLK_HALF | The internally generated PLL frequency is divided by 2 and then output to PORTA. No phase shift. |
| PLLOUT_SELECT_PORTB | Selects the signal to be output at the PLLOUTCOREB and | SHIFTREG_0deg | Oo phase shift only if the setting of FEEDBACK_PATH is "PHASE_AND_DELAY" |
| | PLLOUTGLOBALB ports | SHIFTREG_90deg | 90° phase shift only if the setting of FEEDBACK_PATH is "PHASE_AND_DELAY" and SHIFTREG_DIV_MODE=0 |
| | | GENCLK | The internally generated PLL frequency outputs to PortB. No phase shift. |
| | | GENCLK_HALF | The internally generated PLL frequency is divided by 2 and then output to PORTB. No phase shift. |
| DIVR | /R REFERENCECLK divider | | These parameters are used to control the output frequency, depending on the FEEDBACK_PATH setting. |
| DIVF | Feedback divider | 0,1,,63 | |
| DIVQ | VCO Divider | 1,2,,6 | |
| FILTER_RANGE | PLL Filter Range | 0,1,,7 | |
| EXTERNAL_DIVIDE_FACTOR | Divide-by factor of a divider in external feedback path | User-specified value. Default 1 | Specified only when there is a user-implemented divider in the external feedback path. |
| ENABLE_ICEGATE_PORTA | Enables the PLL power- | 0 | Power-down control disabled |
| | down control | 1 | Power-down controlled by LATCHINPUTVALUE input |
| ENABLE_ICEGATE_PORTB | Enables the PLL power- | 0 | Power-down control disabled |
| | down control | 1 | Power-down controlled by LATCHINPUTVALUE input |

6.5. SB_PLL40_2F_PAD

The SB_PLL40_2F_PAD primitive should be used when the PLL is used to generate two different output frequencies, and the source clock of the PLL is driven by an input pad located in the bottom I/O bank (I/O Bank 2) or the top I/O bank (I/O Bank 0).

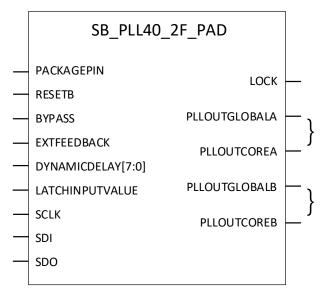

Figure 6.5. SB_PLL40_2F_PAD

Ports

PACKAGEPIN: PLL REFERENCE CLOCK pin that serves as the input to the SB_PLL40_2F_PAD primitive.

PLLOUTGLOBALA: Output clock generated by the PLL, drives a global clock network on the FPGA.

PLLOUTCOREA: Output clock generated by the PLL, drives regular FPGA routing. The frequency generated on this output is the same as the frequency of the clock signal generated on the PLLOUTLGOBALA port.

PLLOUTGLOBALB: Output clock generated by the PLL, drives a global clock network on the FPGA.

PLLOUTCOREB: Output clock generated by the PLL, drives regular FPGA routing. The frequency generated on this output is the same as the frequency of the clock signal generated on the PLLOUTLGOBALB port.

LOCK: Output port, when HIGH, indicates that the signal on PLLOUTGLOBALB/PLLOUTCOREB is locked to the PLL source on PACKAGEPIN.

EXTFEEDBACK: External feedback input to PLL. Enabled when the FEEDBACK PATH parameter is set to EXTERNAL.

DYNAMICDELAY: 4-bit input bus that enables dynamic control of the delay contributed by the Fine Delay Adjust Block.

The Fine Delay Adjust Block is used when there is a need to adjust the phase alignment of

PLLOUTGLOBAL/PLLOUTCORE with respect to PACKAGEPIN. The DYNAMICDELAY port controls are enabled when the DELAY_ADJUSTMENT_MODE parameter is set to DYNAMIC.

RESETB: Active low input that asynchronously resets the PLL.

BYPASS: Input signal, when asserted, connects the signal on PACKAGEPIN to

PLLOUTCORE/PLLOUTGLOBAL pins.

LATCHINPUTVALUE: Active high input, when enabled, forces the PLL into low-power mode. The PLLOUTGLOBALA/PLLOUTCOREA pins are held static at their last value only when the parameter ENABLE_ICEGATE_PORTA is set to '1', and the LATCHINPUTVALUE signal is asserted. The PLLOUTGLOBALB/PLLOUTCOREB pins are held static at their last value only when the parameter ENABLE_ICEGATE_PORTB is set to '1', and the LATCHINPUTVALUE signal is asserted.

SCLK, SDI, SDO: These pins are used only for internal testing purposes, and need not be instantiated by users.

Parameters

The SB_PLL40_2F_PAD primitive requires configuration through the specification of the following parameters. It is strongly recommended that the configuration of the PLL primitives be accomplished through the use of the PLL Configuration tool that is offered as part of the iCEcube2 software.

Table 6.5. SB_PLL40_2F_PAD Parameters

| Parameter Name | Description | Parameter Value | Description |
|---------------------------------|--|-----------------|--|
| FEEDBACK_PATH | Selects the feedback path to the PLL | SIMPLE | Feedback is internal to the PLL, directly from VCO |
| | | DELAY | Feedback is internal to the PLL, through the Fine Delay Adjust Block |
| | | PHASE_AND_DELAY | Feedback is internal to the PLL, through the Phase Shifter and the Fine Delay Adjust Block |
| | | EXTERNAL | Feedback path is external to the PLL, and connects to EXTFEEDBACK pin. Also uses the Fine Delay Adjust Block. |
| DELAY_ADJUSTMENT_MODE _FEEDBACK | Selects the mode for the Fine Delay Adjust block in the feedback path | FIXED | Delay of the Fine Delay Adjust Block is fixed, the value is specified by the FDA_FEEDBACK parameter setting |
| | | DYNAMIC | Delay of Fine Delay Adjust Block is determined by the signal value at the DYNAMICDELAY[3:0] pins |
| FDA_FEEDBACK | Sets a constant value for the Fine Delay Adjust Block in the feedback path | 0, 1,,15 | The PLLOUTGLOBALA and PLLOUTCOREA signals are delay compensated by (n+1)×150 ps, where n = FDA_FEEDBACK only if the setting of the DELAY_ADJUSTMENT_MODE_F EEDBACK is FIXED. |
| DELAY_ADJUSTMENT_MODE _RELATIVE | Selects the mode for the Fine Delay Adjust block | FIXED | Delay of the Fine Delay Adjust Block is fixed, the value is specified by the FDA_RELATIVE parameter setting |
| | | DYNAMIC | Delay of Fine Delay Adjust Block is determined by the signal value at the DYNAMICDELAY[7:4] pins |
| FDA_RELATIVE | Sets a constant value for the Fine Delay Adjust Block | 0, 1,,15 | The PLLOUTGLOBALA and PLLOUTCOREA signals are delayed w.r.t. the Port B signals, by (n+1)×150 ps, where n = FDA_RELATIVE. Used if DELAY_ADJUSTMENT_MODE_RELATIVE is "FIXED". |

| | down control | 1 | Power-down controlled by LATCHINPUTVALUE input |

7. Hard Macro Primitives

7.1. iCE40LM Hard Macros

This section describes the following dedicated hard macro primitives available in iCE40LM devices.

- SB HSOSC (macro primitive for HSSG)
- SB LSOSC (macro primitive for LPSG)
- SB I2C
- SB SPI

7.1.1. SB_HSOSC (For HSSG)

SB_HSOSC primitive can be used to instantiate High Speed Strobe Generator (HSSG), which generates 12 MHz strobe signal. The strobe can drive either the global clock network or fabric routes directly based on the clock network selection.

Figure 7.1. SB_HSOSC

Table 7.1. SB_HSOSC Port Signals

| Signal Name | Direction | Description |
|-------------|-----------|--|
| ENACLKM | Input | Enable High Speed Strobe Generator. Active High. |
| CLKM | Output | Strobe Generator Output (12 MHz). |

Clock Network Selection

By default, the strobe generator use one of the dedicated clock networks in the device to drive the elements. You may configure the strobe generator to use the fabric routes instead of global clock network using the synthesis attributes.

Synthesis Attribute

```
/* synthesis ROUTE_THROUGH_FABRIC=<value> */
```

Value:

0: Use dedicated clock network. Default option.

1: Use fabric routes.

Verilog Instantiation

```
SB_HSOSC OSCInst0 (
.ENACLKM(ENACLKM),
.CLKM(CLKM)
) /* synthesis ROUTE_THROUGH_FABRIC= [0|1] */;
```

All other brand or product names are trademarks or registered trademarks of their respective holders. The specifications and information herein are subject to change without notice

7.1.2. SB_LSOSC (For LPSG)

SB_LSOSC primitive can instantiate Low Power Strobe Generator (LPSG), which generates 10 kHz strobe signal. The strobe can drive either the global clock network or fabric routes directly based on the clock network selection.

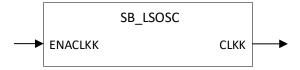

Figure 7.2. SB_LSOSC

Table 7.2. SB_LSOSC Port Signals

| Signal Name | Direction | Description |
|-------------|-----------|---|
| ENACLKK | Input | Enable Low Power Strobe Generator. Active High. |
| CLKK | Output | Strobe Generator Output (10 kHz). |

Clock Network Selection

By default, the strobe generator use one of the dedicated clock networks in the device to drive the elements. You may configure the strobe generator to use the fabric routes instead of global clock network using the synthesis attribute.

Synthesis Attribute:

```
/* synthesis ROUTE_THROUGH_FABRIC=<value> */
```

Value:

- 0: Use dedicated clock network. Default option.
- 1: Use fabric routes.

Verilog Instantiation

```
SB_LSOSC OSCInst0 (
    .ENACLKK(ENACLKK),
    .CLKK(CLKK)
) /* synthesis ROUTE_THROUGH_FABRIC= [0|1] */;
```

7.1.3. SB_I2C

The I²C hard IP provides industry standard two pin communication interface that conforms to the version 2.1 of the I²C bus specification. It could be configured as either master or slave port. In master mode, it support configurable data transfer rate and perform arbitration detection to allow it to operate in multi-master systems. It supports both 7 bits and 10 bits addressing in slave mode with configurable slave address and clock stretching in both master and slave mode with enable/disable capability.

iCE40LM device supports two I²C hard IP primitives, located at upper left corner and upper right corner of the chip.

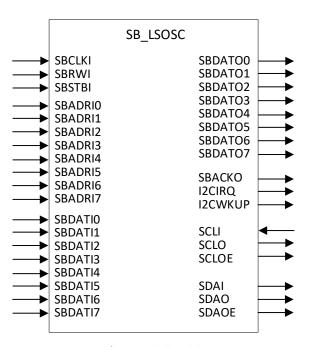

Figure 7.3. SB_I2C

Table 7.3. SB_I2C Port Signals

| Signal Name | Direction | Description |

Parameters

I²C Primitive requires configuring certain parameters for slave initial address and selecting I²C IP location.

Table 7.4. SB_I2C Parameters

| I ² C Location | Parameter | Parameter Default Value | Description |
|---------------------------|---------------------|-------------------------|--|
| Upper Left Corner | I2C_SLAVE_INIT_ADDR | 0b1111100001 | Upper Bits <9:2> can be changed through control registers. Lower bits <1:0> are fixed. |
| | BUS_ADDR74 | 060001 | Fixed value. SBADRI [7:4] bits also should match with this value to activate the IP. |
| Upper Right Corner | I2C_SLAVE_INIT_ADDR | 0b1111100010 | Upper Bits <9:2> can be changed through control registers. Lower bits <1:0> are fixed. |
| | BUS_ADDR74 | 060011 | Fixed value. SBADRI [7:4] bits also should match with this value to activate the IP. |

Synthesis Attribute

Synthesis attribute "I2C_CLK_DIVIDER" is used by PNR and STA tools for optimization and deriving the appropriate clock frequency at SCLO output with respect to the SBCLKI input clock frequency.

/* synthesis I2C_CLK_DIVIDER=[Divide Range] */ Divide Range: 0, 1, 2, 3 ... 1023. Default is 0.

Verilog Instantiation

7.1.4. SB SPI

The SPI hard IP provide industry standard four-pin communication interface with 8-bit wide System Bus to communicate with System Host. It could be configured as Master or Slave SPI port with separate Chip Select Pin. In master mode, it provides programmable baud rate, and supports CS HOLD capability for multiple transfers. It provides variety status flags, such as Mode Fault Error flag, Transmit/Receive status flag, and others for easy communicate with system host.

The iCE40LM device supports two SPI hard IP primitives, located at lower left corner and lower right corner of the chip.

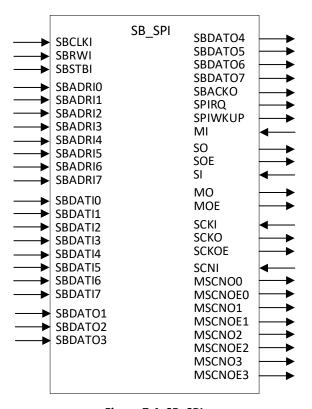

Figure 7.4. SB_SPI

Parameters

SPI Primitive requires configuring a parameter for selecting the SPI IP location.

Table 7.6. SB_SPI Parameters

| SPI Location | Parameter | Parameter Default Value | Description |
|--------------------|------------|-------------------------|--|
| Lower Left Corner | BUS_ADDR74 | 0ь0000 | Fixed value. SBADRI [7:4] bits also should match with this value to activate the IP. |
| Lower Right Corner | BUS_ADDR74 | 0b0010 | Fixed value. SBADRI [7:4] bits also should match with this value to activate the IP. |

Synthesis Attribute

Synthesis attribute "SPI_CLK_DIVIDER" is used by PNR and STA tools for optimization and deriving the appropriate clock frequency at SCKO output with respect to the SBCLKI input clock frequency.

/* synthesis SPI_CLK_DIVIDER= [Divide Range] */ Divide Range

: 0, 1, 2, 3....63. Default is 0.

```

7.2. iCE40 Ultra (iCE5LP) Hard Macros

This section describes the following dedicated hard macro primitives available in iCE5LP (iCE40 Ultra) devices.

- SB HFOSC
- SB LFOSC
- SB_LED_DRV_CUR
- SB_RGB_DRV
- SB_IR_DRV
- SB_IO_OD
- SB_I2C
- SB_SPI
- SB MAC16

7.2.1. **SB_HFOSC**

SB_HFOSC primitive generates 48 MHz nominal clock frequency within +/- 10% variation, with user-programmable divider value of 1, 2, 4, and 8. The HFOSC can drive either the global clock network or fabric routes directly based on the clock network selection.

Figure 7.5. SB_HFOSC

Table 7.7. SB_HFOSC Port Signals

| Signal Name | Direction | Description |
|-------------|-----------|--|
| CLKHFPU | Input | Power up the HFOSC circuit. After power up, the oscillator output is stable after 100 μs. Active High. |
| CLKHFEN | Input | Enable the clock output. Enable should be low for the 100 μs power up period. Active High. |
| CLKHF | Output | HF Oscillator output. |

Table 7.8. SB_HFOSC Parameters

| Parameter | Parameter Values | Description | |
|-----------|------------------|---------------------------|--|
| CLKHF_DIV | "0b00" | Sets 48 MHz HFOSC output. | |
| | "0b01" | Sets 24 MHz HFOSC output. | |
| | "0b10" | Sets 12 MHz HFOSC output. | |
| | "0b11" | Sets 6 MHz HFOSC output | |

Default Signal Values

The iCEcube2 software assigns the following signal value to unconnected port:

Input CLKHFEN: Logic "0" Input CLKHFPU: Logic "0"

Clock Network Selection

By default, the oscillator use one of the dedicated clock networks in the device to drive the elements. You may configure the oscillator to use the fabric routes instead of global clock network using the synthesis attribute.

Synthesis Attributes

/* synthesis ROUTE_THROUGH_FABRIC = <value> */ Value:

0: Use dedicated clock network. Default option.

1: Use fabric routes.

Verilog Instantiation

```
SB_HFOSC OSCInst0 (
.CLKHFEN(ENCLKHF),
.CLKHFPU(CLKHF_POWERUP),
.CLKHF(CLKHF)
) /* synthesis ROUTE_THROUGH_FABRIC= [0|1] */;
defparam OSCInst0.CLKHF_DIV = "0b00";
```

7.2.2. SB LFOSC

SB_LFOSC primitive generates 10 kHz nominal clock frequency within +/- 10% variation. There is no divider on the LFOSC.

The LFOSC can drive either the global clock network or fabric routes directly based on the clock network selection.

Figure 7.6. SB_LFOSC

Table 7.9. SB_LFOSC Port Signals

| Signal Name | Direction | Description | |
|-------------|-----------|---|--|
| CLKLFPU | Input | Power up the LFOSC circuit. After power up, the oscillator output is stable after 100 $\mu s.$ Active High. | |
| CLKLFEN | Input | Enable the clock output. Enable should be low for the 100 μs power up period. Active High. | |
| CLKLF | Output | LF Oscillator output. | |

Default Signal Values

The iCEcube2 software assigns the following signal value to unconnected port:

Input CLKLFEN: Logic "0"
Input CLKLFPU: Logic "0"

Clock Network Selection

By default, the oscillator use one of the dedicated clock networks in the device to drive the elements. You may configure the oscillator to use the fabric routes instead of global clock network using the synthesis attribute.

Synthesis Attributes

/* synthesis ROUTE_THROUGH_FABRIC = <value> */

Value:

0: Use dedicated clock network. Default option.

1: Use fabric routes.

Verilog Instantiation

7.2.3. SB LED DRV CUR

SB_LED_DRV_CUR primitive generates the constant reference current required to power up the SB_RGB_DRV and SB_IR_DRV primitives.

Figure 7.7. SB_LED_DRV_CUR

Table 7.10. SB_LED_DRV_CUR Port Signals

| Signal Name | Direction | Description | |
|-------------|-----------|--|--|
| EN | Input | Enable to generate constant current source for SB_RGB_DRV and SB_IR_DRV primitives. After Enable, the reference current value is stable after 100 µs. Active High. | |
| LEDPU | Output | Power up signal for SB_RGB_DRV and SB_IR_DRV primitives. This port should be connected only to RGBPU/IRPU pins of SB_RGB_DRV and SB_IR_DRV primitives. | |

Default Signal Values

The iCEcube2 software assigns the following signal value to unconnected port:

Input EN: Logic "0"

Verilog Instantiation

```
SB_LED_DRV_CUR    LED_CUR_inst
(
        .EN(enable_led_current),
        .LEDPU(led_power_up)
);
```

7.2.4. SB_RGB_DRV

SB_RGB_DRV primitive contains three dedicated open drain I/O pins for RGB LED outputs. Each of the RGB LED output is bonded out together with an SB_IO_OD primitive to the package pin. You can either use SB_RGB_DRV primitive or the SB_IO_OD primitive to drive the package pin, but not both.

The primitive allows configuration of each of the 3 RGB LED outputs individually. When the RGBx_CURRENT parameter of RGBx output is set to "0b0000000", then SB_IO_OD can be used to drive the package pin.

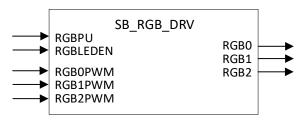

Figure 7.8. SB_RGV_DRV

Table 7.11. SB_RGB_DRV Port Signals

| Signal Name | Direction | Description | |
|-------------|-----------|---|--|
| RGBLEDEN | Input | Enable the SB_RGB_DRV primitive. Active High. | |
| RGBPU | Input | Power Up Signal. Connect to LEDPU port of SB_LED_DRV_CUR primitive. | |
| RGB0PWM | Input | Input data to drive RGB0 LED pin. This input is usually driven from the SB_LEDD_IP. | |
| RGB1PWM | Input | Input data to drive RGB1 LED pin. This input is usually driven from the SB_LEDD_IP. | |
| RGB2PWM | Input | Input data to drive RGB2 LED pin. This input is usually driven from the SB_LEDD_IP. | |
| RGB0 | Output | RGB0 LED output | |
| RGB1 | Output | RGB1 LED output | |
| RGB2 | Output | RGB2 LED output | |

Default Signal Values

The iCEcube2 software assigns the following signal value to unconnected port:

Input RGBLEDEN: Logic "0"
Input RGB0PWM: Logic "0"
Input RGB1PWM: Logic "0"
Input RGB2PWM: Logic "0"
Input RGBPU: Logic "0"

Parameters

```
The SB_RGB_DRV primitive contains the following parameter and their default values:

Parameter RGB0_CURRENT = "0b000000";

Parameter RGB1_CURRENT = "0b000000";

Parameter RGB2_CURRENT = "0b000000";

Parameter values:

"0b000000" = 0 mA. // Set this value to use the associated SB_IO_OD instance at RGB // LED location.

"0b000001" = 4 mA.

"0b000011" = 8 mA.

"0b000111" = 12 mA.

"0b001111" = 16 mA.

"0b011111" = 20 mA.

"0b111111" = 24 mA.
```

Verilog Instantiation

7.2.5. SB_IR_DRV

SB_IR_DRV primitive contains a single dedicated open drain I/O pin for IRLED output. The IRLED output is bonded out together with an SB_IO_OD primitive to the package pin. You can either use SB_IR_DRV primitive or the SB_IO_OD primitive to drive the package pin, but not both.

When the IR_CURRENT parameter is set to "0b0000000000", then SB_IO_OD can be used to drive the package pin.

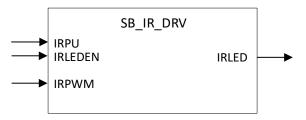

Figure 7.9. SB_IR_DRV

Table 7.12. SB_IR_DRV Port Signals

| Signal Name | Direction | Description | |
|-------------|-----------|---|--|
| IRLEDEN | Input | Enable the SB_IR_DRV primitive. Active High. | |
| IRPU | Input | Power Up Signal. Connect to LEDPU port of SB_LED_DRV_CUR primitive. | |
| IRPWM | Input | PWM Input data to drive IRLED pin. | |
| IRLED | Output | IR LED output. | |

Default Signal Values

The iCEcube2 software assigns the following signal value to unconnected port:

Input IRLEDEN : Logic "0"
Input IRPWM : Logic "0"

Parameter

The SB_IR_DRV primitive contains the following parameter and their default values:

Parameter IR_CURRENT = "0b0000000000";

Parameter Values:

"0b000000000"; = 0 mA. // Set this value to use the associated SB IO OD instance at // IR LED location.

"0b000000001"; = 50 mA

"0b000000011"; = 100 mA

"0b000000111"; = 150 mA

"0b000001111"; = 200 mA

"0b0000011111"; = 250 mA

"0b0000111111"; = 300 mA

"0b0001111111"; = 350 mA

"0b0011111111"; = 400 mA

"0b0111111111"; = 450 mA

"0b1111111111"; = 500 mA

All other brand or product names are trademarks or registered trademarks of their respective holders. The specifications and information herein are subject to change without notice.

Verilog Instantiation

7.2.6. SB_RGB_IP

SB_RGB_IP primitive generates the three RGB PWM outputs, to be connected to the LED drivers.

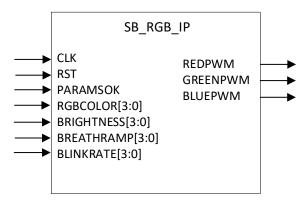

Figure 7.10. SB_RGB_IP

Table 7.13. SB_RGB_IP Port Signals

| Signal Name | Direction | Description | |
|-----------------|-----------|--------------------------------------|--|
| CLK | Input | Clock Input | |
| RST | Input | Asynchronous Reset Input | |
| PARAMSOK | Input | Enable signal to sample the RGB data | |
| RGBCOLOR[3:0] | Input | 4-bit RGB color data input | |
| BRIGHTNESS[3:0] | Input | 4-bit RGB brightness data input | |
| BREATHRAMP[3:0] | Input | 4-bit breathramp data input | |
| BLINKRATE[3:0] | Input | 4-bit blinkrate data input | |
| REDPWM | Output | RED PWM output | |
| GREENPWM | Output | GREEN PWM output | |
| BLUEPWM | Output | BLUE PWM output | |

Default Signal Values

The iCEcube2 software assigns the logic "0" value to all unconnected input ports.

Verilog Instantiation

7.2.7. SB IO OD

The SB_IO_OD is the open drain I/O primitive. When the Tristate output is enabled, the I/O pulls down the package pin signal to zero. The following figure and Verilog template illustrate the complete user accessible logic diagram, and its Verilog instantiation.

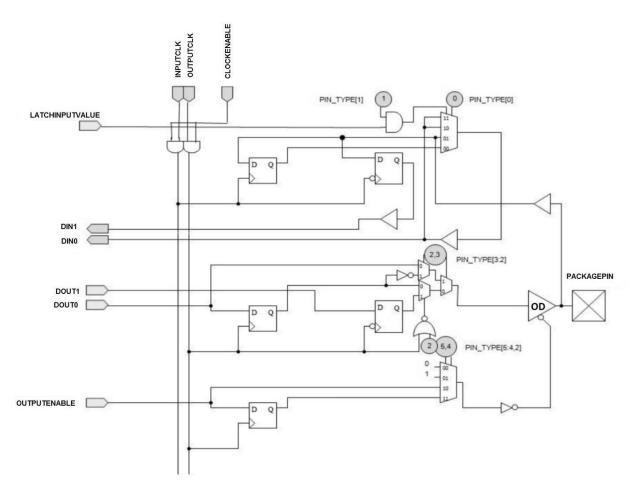

Figure 7.11. SB_IO_OD

© 2016-2021 Lattice Semiconductor Corp. All Lattice trademarks, registered trademarks, patents, and disclaimers are as listed at www.latticesemi.com/legal.
All other brand or product names are trademarks or registered trademarks of their respective holders. The specifications and information herein are subject to change without notice.

Table 7.14. SB_IO_OD Port Signals

| Signal Name | Direction | Description | |
|-----------------|---------------|---------------------------------------|--|
| PACKAGEPIN | Bidirectional | Bidirectional I/O pin | |
| LATCHINPUTVALUE | Input | Latches/Holds the input data | |
| CLOCKENABLE | Input | Clock enable signal | |
| INPUTCLK | Input | Clock for the input registers | |
| OUTPUTCLK | Input | Clock for the output registers | |
| OUTPUTENABLE | Input | Enable Tri-state output. Active high. | |
| DOUT0 | Input | Data to package pin | |
| DOUT1 | Input | Data to package pin | |
| DIN0 | Output | Data from package pin | |
| DIN1 | Output | Data from package pin | |

Default Signal Values

The iCEcube2 software assigns the logic "0" value to all unconnected input ports except for

CLOCKENABLE.

Note that explicitly connecting logic "1" value to port CLOCKENABLE results in a non-optimal implementation, since extra LUT is used to generate the Logic "1". If your intention is to keep the Input and Output registers always enabled, it is recommended that port CLOCKENABLE to be left unconnected.

Parameter Values

```
Parameter PIN_TYPE = 6'b000000;

// See Input and Output Pin Function Tables in SB_IO.

// Default value of PIN_TYPE = 6'b000000

Parameter NEG_TRIGGER = 1'b0;

// Specify the polarity of all FFs in the I/O to be falling edge when NEG_TRIGGER = 1.

Default is 1'b0, rising edge.
```

Input and Output Pin Function Tables

Refer SB_IO Input and Output Pin Functional table for the PIN_TYPE settings. Some of the output pin configurations are not applicable for SB_IO_OD primitive.

Verilog Instantiation

Table 7.15. SB_I2C Port Signals

| Signal Name | Direction | Description | |
|-------------|-----------|---|--|
| SBCLKI | Input | System Clock input | |
| SBRWI | Input | System Read/Write Input | |
| SBSTBI | Input | Strobe Signal | |
| SBADRI0 | Input | System Bus Control registers address. Bit 0. | |
| SBADRI1 | Input | System Bus Control registers address. Bit 1. | |
| SBADRI2 | Input | System Bus Control registers address. Bit 2. | |
| SBADRI3 | Input | System Bus Control registers address. Bit 3. | |
| SBADRI4 | Input | System Bus Control registers address. Bit 4. | |
| SBADRI5 | Input | System Bus Control registers address. Bit 5. | |
| SBADRI6 | Input | System Bus Control registers address. Bit 6. | |
| SBADRI7 | Input | System Bus Control registers address. Bit 7. | |
| SBDATI0 | Input | System Data Input. Bit 0. | |
| SBDATI1 | Input | System Data input. Bit 1. | |
| SBDATI2 | Input | System Data input. Bit 2. | |
| SBDATI3 | Input | System Data input. Bit 3. | |
| SBDATI4 | Input | System Data input. Bit 4. | |
| SBDATI5 | Input | System Data input. Bit 5. | |
| SBDATI6 | Input | System Data input. Bit 6. | |
| SBDATI7 | Input | System Data input. Bit 7. | |
| SBDATO0 | Output | System Data Output. Bit 0. | |
| SBDATO1 | Output | System Data Output. Bit 1. | |
| SBDATO2 | Output | System Data Output. Bit 2. | |
| SBDATO3 | Output | System Data Output. Bit 3. | |
| SBDATO4 | Output | System Data Output. Bit 4. | |
| SBDATO5 | Output | System Data Output. Bit 5. | |
| SBDATO6 | Output | System Data Output. Bit 6. | |
| SBDATO7 | Output | System Data Output. Bit 7. | |
| SBACKO | Output | System Acknowledgement. | |
| I2CIRQ | Output | I ² C Interrupt output. | |
| I2CWKUP | Output | I ² C Wake Up from Standby signal. | |
| SCLI | Input | Serial Clock Input. | |
| SCLO | Output | Serial Clock Output | |
| SCLOE | Output | Serial Clock Output Enable. Active High. | |
| SDAI | Input | Serial Data Input | |
| SDAO | Output | Serial Data Output | |
| SDAOE | Output | Serial Data Output Enable. Active High. | |

Parameters

I²C Primitive requires configuring certain parameters for slave initial address and selecting I²C IP location.

Table 7.16. SB_I2C Parameters

| I2C Location | Parameters | Parameter Default Value | Description |
|--------------------|---------------------|-------------------------|--|
| Upper Left Corner | I2C_SLAVE_INIT_ADDR | 0b1111100001 | Upper Bits <9:2> can be changed through control registers. Lower bits <1:0> are fixed. |
| | BUS_ADDR74 | 0b0001 | Fixed value. SBADRI [7:4] bits also should match with this value to activate the IP. |
| Upper Right Corner | I2C_SLAVE_INIT_ADDR | 0b1111100010 | Upper Bits <9:2> can be changed through control registers. Lower bits <1:0> are fixed. |
| | BUS_ADDR74 | 0b0011 | Fixed value. SBADRI [7:4] bits also should match with this value to activate the IP. |

Synthesis Attribute

I2C_CLK_DIVIDER

Synthesis attribute "I2C_CLK_DIVIDER" is used by PNR and STA tools for optimization and deriving the appropriate clock frequency at SCLO output with respect to the SBCLKI input clock frequency.

/* synthesis I2C_CLK_DIVIDER= Divide Value * / Divide Value: 0, 1, 2, 3 ... 1023. Default is 0.

SDA_INPUT_DELAYED

SDA_INPUT_DELAYED attribute is used to add 50 ns additional delay to the SDAI signal.

/* synthesis SDA_INPUT_DELAYED= value */

Value:

0: No delay.

1: Add 50 ns delay. (Default value).

SDA_OUTPUT_DELAYED

SDA_OUTPUT_DELAYED attribute is used to add 50 ns additional delay to the SDAO signal.

/* synthesis SDA_OUTPUT_DELAYED= value */

Value

0: No delay (Default value).

1: Add 50 ns delay.

7.2.9. SB_SPI

The iCE5LP device supports two SPI hard IP primitives, located at lower left corner and lower right corner of the chip.

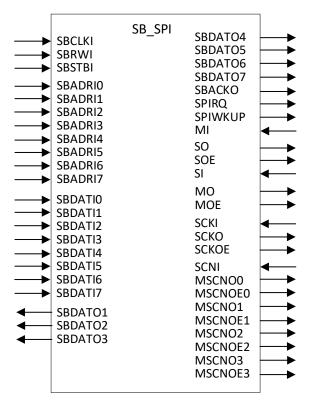

Figure 7.13. SB_SPI

Table 7.17. SB_SPI Port Signals

| Signal Name | Direction | Description | |
|-------------|-----------|--|--|
| SBCLKI | Input | System Clock input. | |
| SBRWI | Input | System Read/Write Input. | |
| SBSTBI | Input | Strobe Signal | |
| SBADRI0 | Input | System Bus Control registers address. Bit 0. | |
| SBADRI1 | Input | System Bus Control registers address. Bit 1. | |
| SBADRI2 | Input | System Bus Control registers address. Bit 2. | |
| SBADRI3 | Input | System Bus Control registers address. Bit 3. | |
| SBADRI4 | Input | System Bus Control registers address. Bit 4. | |
| SBADRI5 | Input | System Bus Control registers address. Bit 5. | |
| SBADRI6 | Input | System Bus Control registers address. Bit 6. | |
| SBADRI7 | Input | System Bus Control registers address. Bit 7. | |
| SBDATI0 | Input | System Data Input. Bit 0. | |

| MCSNOE2 | Output | Master Chip Select Output Enable to PAD. Active High. Line 2 |
| MCSNOE3 | Output | Master Chip Select Output Enable to PAD. Active High. Line 3 |

Parameters

SPI Primitive requires configuring a parameter for selecting the SPI IP location.

Table 7.18. SB_SPI Parameters

| I ² C Location | Parameters | Parameter Default Value | Description |
|---------------------------|------------|-------------------------|--|
| Lower Left Corner | BUS_ADDR74 | 0ь0000 | Fixed value. SBADRI [7:4] bits also should match with this value to activate the IP. |
| Lower Right Corner | BUS_ADDR74 | 060001 | Fixed value. SBADRI [7:4] bits also should match with this value to activate the IP. |

Synthesis Attribute

Synthesis attribute "SPI_CLK_DIVIDER" is used by PNR and STA tools for optimization and deriving the appropriate clock frequency at SCKO output with respect to the SBCLKI input clock frequency.

/* synthesis SPI_CLK_DIVIDER= [Divide Range] */ Divide Range : 0, 1, 2, 3....63. Default is 0.

7.2.10. SB MAC16

The SB_MAC16 primitive is the dedicated configurable DSP block available in iCE5LP devices. The SB_MAC16 can be configured into a multiplier, adder, subtracter, accumulator, multiply-add and multiply- sub through the instance parameters. The SB_MAC16 blocks can be cascaded to implement wider functional units.

iCEcube2 supports a set of predefined SB_MAC16 functional configurations. Refer to the SB_MAC16 Configurations section for the list of supported configurations.

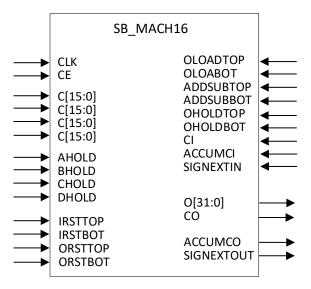

Figure 7.14. SB_MAC16

Port A (Source Clock)

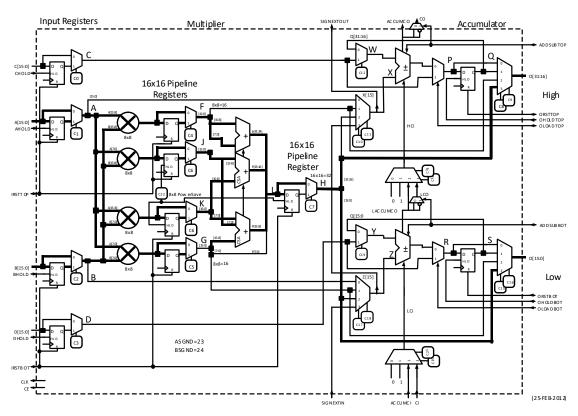

Figure 7.15. SB_MAC16

Port A (Generated Clock)

Table 7.19. SB_MAC16 Port Signals

| Signal Name | Direction | Description | Default Values |
|-------------|-----------|--|----------------|
| CLK | Input | Clock input. Applies to all clocked elements in the MAC16 Block. | |
| CE | Input | Clock Enable Input. Active High. | 1'b1 |
| C[15:0] | Input | Input to the C Register / Direct input to the adder accumulator. | 16'b0 |
| A[15:0] | Input | Input to the A Register / Direct input to the multiplier blocks /Direct input to the adder accumulator. | 16'b0 |
| B[15:0] | Input | Input to the B Register / Direct input to the multiplier blocks /Direct input to the adder accumulator. | 16'b0 |
| D[15:0] | Input | Input to the D Register / Direct input to the adder accumulator. | 16'b0 |
| AHOLD | Input | Hold A registers Data .Controls data flow into the input register A. Active High. 0: Update (load) register at next active clock edge. 1: Hold (retain) current register value, regardless of clock. | 1'b0 |
| BHOLD | Input | Hold B registers Data .Controls data flow into the B input register. Active High. 0: Update (load) register at next active clock edge. 1: Hold (retain) current register value, regardless of clock. | 1'b0 |

| Signal Name | Direction | Description | Default Values |
|-------------|-----------|---|----------------|
| CHOLD | Input | Hold C registers Data. Controls data flow into the A input register. Active High. 0: Update (load) register at next active clock edge. | 1'b0 |
| | | 1: Hold (retain) current register value, regardless of clock. | |
| DHOLD | Input | Hold D registers Data. Controls data flow into the A input register. Active High. 0: Update (load) register at next active clock edge. 1: Hold (retain) current register value, regardless of clock. | 1'b0 |
| IRSTTOP | Innut | Reset input to the A and C input registers, and the pipeline registers in | 1'b0 |
| INSTIUP | Input | the upper half of the multiplier block. Active High | 1 00 |
| IRSTBOT | Input | Reset input to the B and C input registers, and the pipeline registers in the lower half of the multiplier block, and the 32-bit multiplier result pipeline register. Active High. | 1'b0 |
| ORSTTOP | Input | Reset the high-order bits of the accumulator register ([31:16]). Active High. | 1'b0 |
| ORSTBOT | Input | Reset the low-order accumulator register bits ([15:0]). Active High. | 1'b0 |
| OLOADTOP | Input | High-order Accumulator Register Accumulate/Load. Controls whether the accumulator register accepts the output of the adder/subtracter or whether the register is loaded with the value from Input C (or Register C, if configured). O: Accumulator Register [31:16] loaded with output from adder/subtracter. 1: Accumulator Register [31:16] loaded with Input C or Register C, depending on primitive parameter value. | 1'b0 |
| OLOADBOT | Input | Low-order Accumulator Register Accumulate/Load. Controls whether the low-order accumulator register bits (15:0] accepts the output of the adder/subtracter or whether the register is loaded with the value from Input D (or Register D, if configured). O: Accumulator Register [15:0] loaded with output from adder/subtracter. 1: Accumulator Register [15:0] loaded with Input D or Register D, depending on primitive parameter value. | 1'b0 |
| ADDSUBTOP | Input | High-order Add/Subtract. Controls whether the adder/subtracter adds or subtracts. 0: Add: W+X+HCl 1: Subtract: W-X-HCl | 1'b0: Add |
| ADDSUBBOT | input | Low-order Add/Subtract. Controls whether the adder/subtracter adds or subtracts. 0: Add: Y+Z+LCI 1: Subtract: Y-Z-LCI | 1'b0: Add |
| OHOLDTOP | Input | High-order Accumulator Register Hold. Controls data flow into the high-order ([31:16]) bits of the accumulator. 0: Update (load) register at next active clock edge. 1: Hold (retain) current register value, regardless of clock. | |
| OHOLDBOT | Input | Low-order Accumulator Register Hold. Controls data flow into the high-order ([15:0]) bits of the accumulator. 0: Update (load) register at next active clock edge. 1: Hold (retain) current register value, regardless of clock. | |
| CI | Input | Carry/borrow input from lower logic tile. | |
| ACCUMCI | Input | Cascade Carry/borrow input from lower MAC16 block. | |
| SIGNEXTIN | Input | Sign extension input from lower MAC16 block. | |

| Signal Name | Direction | Description | Default Values |
|-------------|-----------|---|----------------|
| O[31:0] | Output | 32-bit MAC16 Output. | |
| | | O[31:0]: 32-bit result of a 16x16 multiply operation or a 32-bit adder/accumulate function. | |
| | | O[31:16]: 16-bit result of an 8x8 multiply operation or a 32-bit adder/accumulate function. | |
| | | O[15:0]: 16-bit result of an 8x8 multiply operation or a 32-bit adder/accumulate function. | |
| СО | Output | Carry/borrow output to higher logic tile. | |
| ACCUMCO | Output | Cascade Carry/borrow output to higher MAC16 block. | |
| SIGNEXTOUT | Output | Sign extension output to higher MAC16 block. | |

Parameters

The parameter table below shows the list of parameters to configure the SB_MAC16 block. This table also maps the parameter to the configuration bits shown in the SB_MAC16 Functional diagram.

Table 7.20. SB MAC16 Parameters

| Parameter Name | Configuration Bits | Parameter Description | Value | Description | | | | |
|--------------------------|--------------------|--|-------|---|--|--|--|--|
| NEG_TRIGGER | | Controls input clock polarity | 0 | All the registers are rising_edge triggered. | | | | |
| | | | 1 | All the registers are falling_edge triggered. | | | | |
| C_REG | CO | Input C register Control. | 0 | Input C not registered | | | | |
| | | | 1 | Input C registered | | | | |
| A_REG | C1 | Input A register Control | 0 | Input A not registered | | | | |
| | | | 1 | Input A registered | | | | |
| B_REG | C2 | Input B register Control | 0 | Input B not registered | | | | |
| | | | 1 | Input B registered | | | | |
| D_REG | C3 | Input D register Control | 0 | Input D not registered | | | | |
| | | | 1 | Input D registered | | | | |
| TOP_8x8_MULT_REG | C4 | Top 8x8 multiplier output register control | 0 | Top 8x8 multiplier output is no registered. | | | | |
| | | (point F) | 1 | Top 8x8 multiplier output is registered. | | | | |
| BOT_8x8_MULT_REG | C5 | Bottom 8x8 multiplier output register control. | 0 | Bottom 8x8 multiplier output is not registered. | | | | |
| | | (point G) | 1 | Bottom 8x8 multiplier output is registered | | | | |
| PIPELINE_16x16_MULT_REG1 | C6 | Intermediate 8x8 multiplier pipeline | 0 | Intermediate 8x8 multiplier outputs are not registered. | | | | |
| | | register controls (points J and K). These multipliers are only used for 16x16 multiply operations. For 8x8 multiply operations, set C6 and C7 to 1, which reduces power consumption. | 1 | Intermediate 8x8 multiplier outputs are registered. | | | | |

| Parameter Name | Configuration Bits | Parameter Description | Value | Description |
|--------------------------|--------------------|--|-------|---|
| PIPELINE_16x16_MULT_REG2 | C7 | 16x16 multiplier Pipeline registers | 0 | 32-bit output from 16x16 multiplier is not registered. |
| | | control. (point H) | 1 | 32-bit output from 16x16 multiplier is registered. |
| TOPOUTPUT_SELECT | C9,C8 | Selects Top SB_MAC16 output O[31:16]. | 00 | 16-bit output of Multiplexer P, from top adder/subtracter, |
| | | | 01 | 16-bit output from upper accumulator register, Q |
| | | | 10 | 16-bit output from upper 8x8 multiplier, F |
| | | | 11 | Upper 16-bit output from 16x16 multiplier, H |
| TOPADDSUB_LOWERINPUT | C11,C10 | Selects input X for the upper adder/subtracter | 00 | 16-bit input from A input or associated input register. |
| | | | 01 | 16-bit output from upper 8x8 multiplier, F |
| | | | 10 | Upper 16-bit output from 16x16 multiplier, H |
| | | | 11 | Sign extension input from lower adder/subtracter, Z[15]. Duplicate 16 bits. |
| TOPADDSUB_UPPERINPUT | C12 | Selects input W for the upper adder/subtracter | 0 | 16-bit feedback from upper accumulator register, Q |
| | | | 1 | 16-bit input from C input or associated pipeline register |
| TOPADDSUB_CARRYSELECT | C14,C13 | Carry/borrow input | 00 | Constant 0 |
| | | select to upper | 01 | Constant 1 |
| | | adder/subtracter. | 10 | Cascade Carry/borrow output from lower adder/subtracter |
| | | | 11 | Carry/borrow output from lower adder/subtracter |
| BOTOUTPUT_SELECT | C16,C15 | Selects Lower SB_MAC16 output | 00 | 16-bit output of multiplexer R from lower adder/subtracter |
| | | O[15:0]. | 01 | 16-bit output from lower accumulator register, S |
| | | | 10 | 16-bit output from lower 8x8 multiplier, G |
| | | | 11 | Lower 16-bit output from 16x16 multiplier, H |
| BOTADDSUB_LOWERINPUT | C18,C17 | Selects Input Z for the lower dder/subtracter | 00 | 16-bit input from B input or associated pipeline register |
| | | | 01 | 16-bit output from lower 8x8 multiplier, G |
| | | | 10 | Lower 16-bit output from 16x16 multiplier, H |
| | | | 11 | Sign extension input SIGNEXTIN. Duplicate 16 bits. |
| BOTADDSUB_UPPERINPUT | C19 | Selects Input Y for the lower adder/subtracter | 0 | 16-bit feedback from lower accumulator register, S |
| | | | 1 | 16-bit input from D input or associated input register. |

| Parameter Name | Configuration Bits | Parameter Description | Value | Description |
|-----------------------|--------------------|---|-------|---|
| BOTADDSUB_CARRYSELECT | C21,C20 | Carry/borrow input | 00 | Constant 0 |
| | | select to lower | 01 | Constant 1 |
| | | adder/subtracter | 10 | Cascade Carry/borrow input from ACCUMCI |
| | | | 11 | Carry/borrow input from CI |
| MODE_8x8 | C22 | Selects 8x8 Multiplier | 0 | No effect |
| | | mode and 8x8 Low- Power Multiplier Blocking Option | 1 | Selects 8x8 Multiplier mode. Holds the pipelining registers associate with a 16x16 multiplier in clock disable mode. Helps reduce the dynamic power consumption within the multiplier function. Used in conjunction with C6, C7 settings. |
| A_SIGNED | C23 | Indicates whether | 0 | Multiplier input A is unsigned. |
| | | multiplier input A is signed or unsigned. Applies regardless if input A is 16-or 32- bits wide. | 1 | Multiplier input A is signed. |
| B_SIGNED | C24 | Indicates whether | 0 | Multiplier input B is unsigned. |
| | | multiplier input B is signed or unsigned. Applies regardless if input B is 16-or 32- bits wide. | 1 | Multiplier input B is signed. |

7.2.10.1. SB_MAC16 Configurations

The following SB_MAC16 functional blocks are supported in iCEcube2.

- Multiplier
- Multiply and Accumulate (MAC)
- Accumulator (ACC)
- Add/Subtract (ADD/SUB)
- Multiply and Add/Subtract (MULTADDSUB)

The valid configuration parameter settings for each functional block are listed below.

Note: Read the configuration settings from left to right while filling the SB_MAC16 instance parameter values.

Multiplier Configurations

8×8 Multiplier : 8×8 input multiplier with 16-bit output. 16×16 Multiplier : 16×16 input multiplier with 32-bit output.

Table 7.21. Multiplier Configurations

7.3. iCE40 UltraLite (iCE40UL) Hard Macros

This section describes the following dedicated hard macro primitives available in the iCE40 UltraLite device.

- SB_HFOSC
- SB LFOSC
- SB RGBA DRV
- SB IR400 DRV
- SB_BARCODE_DRV
- SB_IR500_DRV
- SB LEDDA IP
- SB IR IP
- SB IO OD
- SB_I2C_FIFO

7.3.1. SB_HFOSC

SB_HFOSC primitive generates 48 MHz nominal clock frequency within +/- 10% variation, with user-programmable divider value of 1, 2, 4, and 8. The HFOSC can drive either the global clock network or fabric routes directly based on the clock network selection.

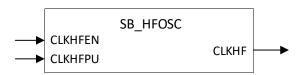

Figure 7.16. SB_HFOSC

Table 7.26. SB_HFOSC Port Signals

| Signal Name | Direction | Description |
|-------------|-----------|---|
| CLKHFPU | Input | Power up the HFOSC circuit. After power up, the oscillator output is stable after 100 μ s. Active High. |
| CLKHFEN | Input | Enable the clock output. Enable should be low for the 100 μs power up period. Active High. |
| CLKHF | Output | HF Oscillator output. |

Parameters

Table 7.27. SB HFOSC Parameters

| Parameter | Parameter Values | Description |
|-----------|------------------|---------------------------|
| CLKHF_DIV | "0b00" | Sets 48 MHz HFOSC output. |
| | "0b01" | Sets 24 MHz HFOSC output. |
| | "0b10" | Sets 12 MHz HFOSC output. |
| | "0b11" | Sets 6 MHz HFOSC output |

Default Signal Values

The iCEcube2 software assigns the following signal value to unconnected port:

Input CLKHFEN: Logic "0"Input CLKHFPU: Logic "0"

Clock Network Selection

By default, the oscillator use one of the dedicated clock networks in the device to drive the elements. You may configure the oscillator to use the fabric routes instead of global clock network using the synthesis attribute.

Synthesis Attributes

/* synthesis ROUTE THROUGH FABRIC = <value> */ Value:

0: Use dedicated clock network. Default option.

1: Use fabric routes.

Verilog Instantiation

7.3.2. SB_LFOSC

SB_LFOSC primitive generates 10 kHz nominal clock frequency within +/- 10% variation. There is no divider on the LFOSC.

The LFOSC can drive either the global clock network or fabric routes directly based on the clock network selection.

Figure 7.17. SB_LFOSC

Table 7.28. SB_LFOSC Port Signals

| Signal Name | Direction | Description | | | | | | | |
|-------------|-----------|---|--|--|--|--|--|--|--|
| CLKLFPU | Input | Power up the LFOSC circuit. After power up, the oscillator output is stable after 100 μ s. Active High. | | | | | | | |
| CLKLFEN | Input | Enable the clock output. Enable should be low for the 100 μs power up period. Active High. | | | | | | | |
| CLKLF | Output | LF Oscillator output. | | | | | | | |

Default Signal Values

The iCEcube2 software assigns the following signal value to unconnected port:

Input CLKLFEN: Logic "0" Input CLKLFPU: Logic "0"

Clock Network Selection

By default, the oscillator use one of the dedicated clock networks in the device to drive the elements. You may configure the oscillator to use the fabric routes instead of global clock network using the synthesis attribute.

Synthesis Attributes

/* synthesis ROUTE_THROUGH_FABRIC = <value> */ Value:

0: Use dedicated clock network. Default option.

1: Use fabric routes.

Verilog Instantiation

7.3.3. SB_RGBA_DRV

SB_RGBA_DRV primitive is the RGB LED drive module which contains three dedicated open drain I/O pins for RGB LED outputs. Each of the RGB LED output is bonded out together with an SB_IO_OD primitive to the package pin. You can either use SB_RGB_DRV primitive or the SB_IO_OD primitive to drive the package pin, but not both.

The primitive allows configuration of each of the three RGB LED outputs individually. When the RGBx_CURRENT parameter of RGBx output is set to "0b0000000", then SB_IO_OD can be used to drive the package pin.

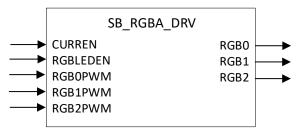

Figure 7.18. SB_RGBA_DRV

Table 7.29. SB_RGBA_DRV Port Signals

| Signal Name | Direction | Description |
|-------------|-----------|---|
| CURREN | Input | Enable the mixed signal control block to supply reference current to the IR drivers. When it is not enabled, (CURREN=0), no current is supplied, and the IR drivers are powered down. Enabling the mixed signal control block takes 100 µs to reach a stable reference current value. |
| RGBLEDEN | Input | Enable the SB_RGB_DRV primitive. Active High. |
| RGB0PWM | Input | Input data to drive RGB0 LED pin. This input is usually driven from the SB_LEDD_IP. |
| RGB1PWM | Input | Input data to drive RGB1 LED pin. This input is usually driven from the SB_LEDD_IP. |
| RGB2PWM | Input | Input data to drive RGB2 LED pin. This input is usually driven from the SB_LEDD_IP. |
| RGB0 | Output | RGB0 LED output. |
| RGB1 | Output | RGB1 LED output. |
| RGB2 | Output | RGB2 LED output. |

All other brand or product names are trademarks or registered trademarks of their respective holders. The specifications and information herein are subject to change without notice.

Default Signal Values

The iCEcube2 software assigns the following signal value to unconnected port:

Input CURREN : Logic "0"
Input RGBLEDEN : Logic "0"
Input RGB0PWM : Logic "0"
Input RGB1PWM : Logic "0"
Input RGB2PWM : Logic "0"

Parameters

The SB_RGBA_DRV primitive contains the following parameter and their default values:

```
Parameter CURRENT_MODE = "0b0"; Parameter values:

"0b0" = Full Current Mode (Default).

"0b1" = Half Current Mode.

Parameter RGB0_CURRENT = "0b000000";

Parameter RGB1_CURRENT = "0b000000";

Parameter RGB2_CURRENT = "0b000000";

Parameter values:

"0b000000" = 0 mA. // Set this value to use the associated SB_IO_OD instance at RGB // LED location.

"0b000001" = 4 mA for Full Mode; 2 mA for Half Mode

"0b00011" = 8 mA for Full Mode; 4 mA for Half Mode.

"0b001111" = 12 mA for Full Mode; 6 mA for Half Mode.

"0b001111" = 20 mA for Full Mode; 8 mA for Half Mode

"0b011111" = 24 mA for Full Mode; 10 mA for Half Mode.

"0b111111" = 24 mA for Full Mode; 12 mA for Half Mode.
```

Verilog Instantiation

7.3.4. SB_IR400_DRV

SB_IR400_DRV primitive is the IR driver which contains a single dedicated open drain I/O pin for IRLED output. The IRLED output is bonded out together with an SB_IO_OD primitive to the package pin. You can either use SB_IR400_DRV primitive or the SB_IO_OD primitive to drive the package pin, but not both.

When the IR400_CURRENT parameter is set to "0b000000000", then SB_IO_OD can be used to drive the package pin.

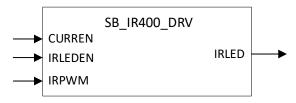

Figure 7.19. SB_IR400_DRV

Table 7.30. SB_IR400_DRV Port Signals

| Signal Name | Direction | Description |
|-------------|-----------|--|
| CURREN | Input | Enable the mixed signal control block to supply reference current to the IR drivers. When it is not enabled (CURREN=0), no current is supplied, and the IR drivers are powered down. Enabling the mixed signal control block takes 100 µs to reach a stable reference current value. |
| IRLEDEN | Input | Enable the SB_IR400_DRV primitive. Active High. |
| IRPWM | Input | PWM Input data to drive IRLED pin. |
| IRLED | Output | IR LED output. |

Default Signal Values

The iCEcube2 software assigns the following signal value to unconnected port:

Input CURREN : Logic "0"
Input IRLEDEN : Logic "0"
Input IRPWM : Logic "0"

Parameter

The SB_IR400_DRV primitive contains the following parameter and their default values:

```
Parameter CURRENT_MODE = "0b0";
Parameter values:
"0b0" = Full Current Mode (Default).
"0b1" = Half Current Mode.

Parameter IR400_CURRENT = "0b00000000";
Parameter Values:
"0b000000000"; = 0 mA. //This is the setting to tristate the IR output to allow it to be used as GPIO (SB_IO_OD)
"0b00000001"; = 50 mA for Full Mode; 25 mA for Half Mode.
"0b00000011"; = 100 mA for Full Mode; 50 mA for Half Mode.
"0b00000111"; = 150 mA for Full Mode; 75 mA for Half Mode.
"0b00001111"; = 200 mA for Full Mode; 100 mA for Half Mode.
"0b00011111"; = 250 mA for Full Mode; 125 mA for Half Mode.
"0b001111111"; = 350 mA for Full Mode; 150 mA for Half Mode.
"0b011111111"; = 350 mA for Full Mode; 175 mA for Half Mode.
"0b011111111"; = 400 mA for Full Mode; 200 mA for Half Mode.
```

Verilog Instantiation

7.3.5. SB_BARCODE_DRV

SB_BARCODE_DRV primitive contains a single dedicated open drain I/O pin for BARCODE output. The BARCODE output is bonded out together with an SB_IO_OD primitive to the package pin. You can either use SB_BARCODE_DRV primitive or the SB_IO_OD primitive to drive the package pin, but not both.

When the BARCODE_CURRENT parameter is set to "0b0000", SB_IO_OD can be used to drive the package pin.

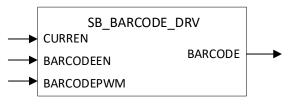

Figure 7.20. SB_BARCODE_DRV

Table 7.31. SB BARCODE DRV Port Signals

| Signal Name | Direction | Description |
|-------------|-----------|---|
| CURREN | Input | Enable the mixed signal control block to supply reference current to the IR drivers. When it is not enabled (CURREN=0), no current is supplied, and the IR drivers are powered down. Enabling the mixed signal control block takes $100~\mu s$ to reach a stable reference current value. |
| BARCODEN | Input | Enable the SB_BARCODE_DRV primitive. Active High. |
| BARCODEPWM | Input | PWM Input data to drive BARCODE pin. |
| BARCODE | Output | BARCODE output. |

Default Signal Values

The iCEcube2 software assigns the following signal value to unconnected port:

Input CURREN : Logic "0"
Input BARCODEEN : Logic "0"
Input BARCODEPWM : Logic "0"

Parameter

The SB_BARCODE_DRV primitive contains the following parameter and their default values:

Parameter CURRENT_MODE = "0b0";

Parameter values:

"0b0" = Full Current Mode (Default).

"0b1" = Half Current Mode.

Parameter BARCODE_CURRENT = "0b0000";

Parameter values:

"0b0000" = 0 mA.//This is the setting to tri-state the BARCODE output to allow it to be used // as GPIO (SB_IO_OD)

"0b0001" = 16.6 mA for Full Mode; 8.3 mA for Half Mode,

"0b0011" = 33.3 mA for Full Mode; 16.6 mA for Half Mode,

"0b1001" = 66.6 mA for Full Mode; 33.3 mA for Half Mode,

"0b1010" = 83.3 mA for Full Mode; 41.6 mA for Half Mode,

"0b0111" = 50 mA for Full Mode; 25 mA for Half Mode,

"0b1111" = 100 mA for Full Mode; 50 mA for Half Mode

Verilog Instantiation

7.3.6. SB_IR500_DRV

SB_IR500_DRV primitive is the IR driver which contains a two dedicated open drain I/O pin for IRLED1, IRLED2 outputs. The IRLED outputs are bonded out together with an SB_IO_OD primitive to the package pin. You can either use SB_IR500_DRV primitive or the SB_IO_OD primitive to drive the package pin, but not both.

When the IR4500_CURRENT parameter is set to "0b00000000", then SB_IO_OD can be used to drive the package pin.

Figure 7.21. SB_IR500_DRV

SB_IR500_DRV DRC Rule

This primitive cannot be instantiated along with SB_BARCODE_DRV or SB_IR400_DRV instance.

Table 7.32. SB IR500 DRV Port Signals

| Direction | Description | | | | | | | |
|-----------|--|--|--|--|--|--|--|--|
| Input | Enable the mixed signal control block to supply reference current to the IR drivers. When it is not enabled (CURREN=0), no current is supplied, and the IR drivers are powered down. Enabling the mixed signal control block takes 100 µs to reach a stable reference current value. | | | | | | | |
| Input | Enable the SB_IR400_DRV primitive. Active High. | | | | | | | |
| Input | PWM Input data to drive IRLED pin. | | | | | | | |
| Output | IR LED output 1. | | | | | | | |
| Output | IR LED output 2. | | | | | | | |
| | Input Input Input Output | | | | | | | |

Default Signal Values

The iCEcube2 software assigns the following signal value to unconnected port:

Input CURREN : Logic "0"
Input IRLEDEN : Logic "0"
Input IRPWM : Logic "0"

Parameters

The SB_IR500_DRV primitive contains the following parameter and their default values:

```
Parameter CURRENT MODE = "0b0";
Parameter values:
"0b0"; = Full Current Mode (Default).
"0b1"; = Half Current Mode.
Parameter IR500_CURRENT = "0b00000000000";
Parameter values:
"0b0000000000"; = 0 mA. // This is the setting to tristate the BARCODE output to allow it to // be used as GPIO
(SB_IO_OD).
"0b00000000111"; = 50 mA for Full Mode; 25 mA for Half Mode.
"0b00000001111"; = 100 mA for Full Mode; 50 mA for Half Mode.
"0b00000011111"; = 150 mA for Full Mode; 75 mA for Half Mode.
"0b00000111111"; = 200 mA for Full Mode; 100 mA for Half Mode.
"0b000001111111"; = 250 mA for Full Mode; 125 mA for Half Mode.
"0b000011111111"; = 300 mA for Full Mode; 150 mA for Half Mode.
"0b000111111111"; = 350 mA for Full Mode; 175 mA for Half Mode.
"0b001111111111"; = 400 mA for Full Mode; 200 mA for Half Mode.
"0b01111111111"; = 450 mA for Full Mode; 225 mA for Half Mode.
"0b1111111111"; = 500 mA for Full Mode; 250 mA for Half Mode.
```

Verilog Instantiation

7.3.7. **SB_LEDDA_IP**

SB_LEDDA_IP primitive generates the RGB PWM outputs for the RGB LED drivers. The IP contains registers that are programmed in by the SCI bus interface signals.

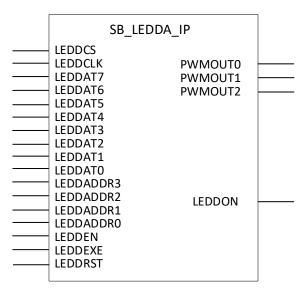

Figure 7.22. SB_LEDDA_IP

Table 7.33. SB_LEDDA_IP Port Signals

| Signal Name | Direction | Description |
|-------------|-----------|---|
| LEDDCS | Input | CS to write LEDD IP registers |
| LEDDCLK | Input | Clock to write LEDD IP registers |
| LEDDDAT7 | Input | Bit 7 data to write into the LEDD IP registers |
| LEDDDAT6 | Input | Bit 6 data to write into the LEDD IP registers |
| LEDDDAT5 | Input | Bit 5 data to write into the LEDD IP registers |
| LEDDDAT4 | Input | Bit 4 data to write into the LEDD IP registers |
| LEDDDAT3 | Input | Bit 3 data to write into the LEDD IP registers |
| LEDDDAT2 | Input | Bit 2 data to write into the LEDD IP registers |
| LEDDDAT1 | Input | Bit 1 data to write into the LEDD IP registers |
| LEDDDAT0 | Input | Bit 0 data to write into the LEDD IP registers |
| LEDDADDR3 | Input | LEDD IP register address bit 3 |
| LEDDADDR2 | Input | LEDD IP register address bit 2 |
| LEDDADDR1 | Input | LEDD IP register address bit 1 |
| LEDDADDR0 | Input | LEDD IP register address bit 0 |
| LEDDDEN | Input | Data enable input to indicate data and address are stable. |
| LEDDEXE | Input | Enable the IP to run the blinking sequence. When it is LOW, the sequence stops at the nearest OFF state. |
| LEDDRST | Input | Device level reset signal to reset all internal registers during the device configuration. This port is not accessible to user signals. |
| PWMOUT0 | Output | PWM output 0 |
| PWMOUT1 | Output | PWM output 1 |
| PWMOUT2 | Output | PWM output 2 |
| LEDDON | Output | Indicating the LED is on |

7.3.8. SB IR IP

SB_IR_IP primitive is the IR transceiver module. It generates or receives the modulated pulse for the IR driver primitives.

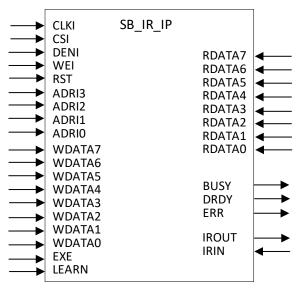

Figure 7.23. SB_IR_IP

© 2016-2021 Lattice Semiconductor Corp. All Lattice trademarks, registered trademarks, patents, and disclaimers are as listed at www.latticesemi.com/legal.

All other brand or product names are trademarks or registered trademarks of their respective holders. The specifications and information herein are subject to change without notice

Table 7.34. SB_IR_IP Port Signals

| Signal Name | Direction | Description |
|-------------|-----------|---|
| CLKI | Input | Clock input for IR IP |
| CSI | Input | Select Signal. Active High to activate the IP. This usually connects to the output |
| DENI | Innut | of the decoding logic from MSB of the address bus |
| DENI | Input | Data Enable. When asserted, indicates that the data and address on the IR Transceiver Control Bus are stabilized and ready to be captured. |
| WEI | Input | Data Write Enable. Asserted during WRITE and deasserted during READ cycle. |
| ADRI3 | Input | Control Register Address Bit 3 |
| ADRI2 | Input | Control Register Address Bit 2 |
| ADRI1 | Input | Control Register Address Bit 1 |
| ADRI0 | Input | Control Register Address Bit 0 |
| WDATA7 | Input | Write Data Input Bit 7 |
| WDATA6 | Input | Write Data Input Bit 6 |
| WDATA5 | Input | Write Data Input Bit 5 |
| WDATA4 | Input | Write Data Input Bit 4 |
| WDATA3 | Input | Write Data Input Bit 3 |
| WDATA2 | Input | Write Data Input Bit 2 |
| WDATA1 | Input | Write Data Input Bit 1 |
| WDATA0 | Input | Write Data Input Bit 0 |
| RDATA7 | Output | Read Data Output Bit 7 |
| RDATA6 | Output | Read Data Output Bit 6 |
| RDATA5 | Output | Read Data Output Bit 5 |
| RDATA4 | Output | Read Data Output Bit 4 |
| RDATA3 | Output | Read Data Output Bit 3 |
| RDATA2 | Output | Read Data Output Bit 2 |
| RDATA1 | Output | Read Data Output Bit 1 |
| RDATA0 | Output | Read Data Output Bit 0 |
| EXE | Input | Execute. When asserted, starts the IR Transceiver Hard IP to transmit or receive IR data |
| LEARN | Input | Learning Mode control. When asserted, the IR Transceiver is in learning mode. The IR Transceiver receives data instead of transmit data. |
| BUSY | Output | Busy status output |
| DRDY | Output | Data Buffer Ready status output |
| ERR | Output | Data Error status |
| RST | Input | Device level reset signal to reset all internal registers and IROUT signal to OFF state during the device configuration. This port is not accessible to user signals. |
| IRIN | Input | Modulated ON/OFF pulse from IR sensor. |
| IROUT | Output | Modulated ON/OFF pulse from its sensor. Modulated ON/OFF pulse for IR Transmit. |
| 11.001 | σαιραί | Modulated OnyOTT puise for in Transfillt. |

Default Signal Values

The iCEcube2 software assigns the logic "0" value to all unconnected input ports.

Verilog Instantiation

);
```

7.3.9. SB_IO_OD

The SB_IO_OD is the open drain I/O primitive. When the Tristate output is enabled, the I/O pulls down the package pin signal to zero. The following figure and Verilog template illustrate the complete user accessible logic diagram, and its Verilog instantiation.

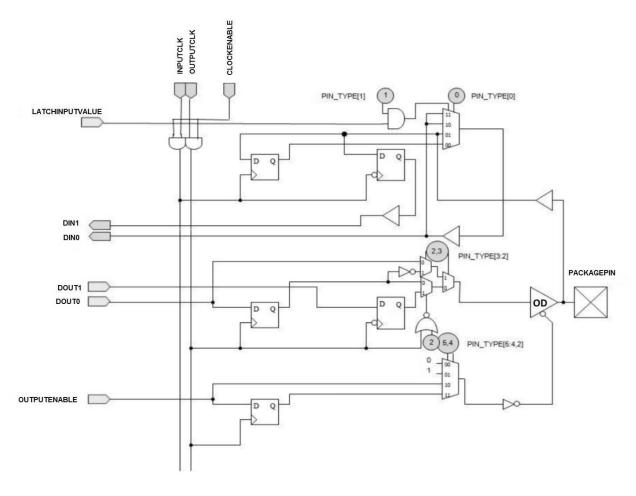

Figure 7.24. SB_IO_OD

Table 7.35. SB IO OD Port Signals

| Table 7.55.55_16_65 Tote 516.11.15 | | |
|------------------------------------|---------------|--------------------------------------|
| Signal Name | Direction | Description |
| PACKAGEPIN | Bidirectional | Bidirectional I/O pin. |
| LATCHINPUTVALUE | Input | Latches/Holds the input data. |
| CLOCKENABLE | Input | Clock enable signal. |
| IRLED1 | Output | IR LED output 1. |
| IRLED2 | Output | IR LED output 2. |
| INPUTCLK | Input | Clock for the input registers. |
| OUTPUTCLK | Input | Clock for the output registers. |
| OUTPUTENABLE | Input | Enable Tristate output. Active high. |
| DOUT0 | Input | Data to package pin. |
| DOUT1 | Input | Data to package pin. |
| DIN0 | Output | Data from package pin. |
| DIN1 | Output | Data from package pin. |

© 2016-2021 Lattice Semiconductor Corp. All Lattice trademarks, registered trademarks, patents, and disclaimers are as listed at www.latticesemi.com/legal. All other brand or product names are trademarks or registered trademarks of their respective holders. The specifications and information herein are subject to change without notice.

Default Signal Values

The iCEcube2 software assigns the logic "0" value to all unconnected input ports except for CLOCKENABLE.

Note that explicitly connecting logic "1" value to port CLOCKENABLE results in a non-optimal implementation, since extra LUT is used to generate the Logic "1". If your intention is to keep the Input and Output registers always enabled, it is recommended that port CLOCKENABLE to be left unconnected.

Parameters

```
Parameter PIN_TYPE = 6'b0000000;

// See Input and Output Pin Function Tables in SB_IO.

// Default value of PIN_TYPE = 6'b000000

Parameter NEG_TRIGGER = 1'b0;

// Specify the polarity of all FFs in the I/O to be falling edge when NEG_TRIGGER = 1.

Default is 1'b0, rising edge.
```

Input and Output Pin Function Tables

Refer SB_IO Input and Output Pin Functional Table for the PIN_TYPE settings. Some of the output pin configurations are not applicable for SB_IO_OD primitive.

Verilog Instantiation

```
OpenDrainInst0 (
SB IO OD
.PACKAGEPIN (PackagePin),
                                           // User's Pin signal name
.LATCHINPUTVALUE (latchinputvalue),
                                           // Latches/holds the Input value
                                           // Clock Enable common to input and
.CLOCKENABLE (clockenable),
                                          // output clock

| TXFIFOAEMPTY* | Output | TX FIFO Status Signal |
| TXFIFOEMPTY* | Output | TX FIFO Status Signal |
| TXFIFOFULL* | Output | TX FIFO Status Signal |
| RXFIFOAFULL* | Output | RX FIFO Status Signal |
| RXFIFOFULL* | Output | RX FIFO Status Signal |
| RXFIFOEMPTY* | Output | RX FIFO Status Signal |
| MRDCMPL* | Output | Master Read Complete (only valid for Master Read Mode) |

*Note: Only available if I2C_FIFO_ENB = ENABLED.

Parameters

Table 7.37. SB_I2C_FIFO Parameters

| I ² C Location | Parameter | Parameter Default | Description |
|---------------------------|-----------------|-------------------|--|
| Left Side Corner | I2C_SLAVE _ADDR | 0b1111100001 | Upper Bits <9:2> can be changed through control registers. Lower bits <1:0> are fixed. |
| Right Side | I2C_SLAVE _ADDR | 0b1111100010 | Upper Bits <9:2> can be changed through control registers. Lower bits <1:0> are fixed. |

Synthesis Attribute

I2C_CLK_DIVIDER

Synthesis attribute "I2C_CLK_DIVIDER" is used by PNR and STA tools for optimization and deriving the appropriate clock frequency at SCLO output with respect to the SBCLKI input clock frequency.

/* synthesis I2C_CLK_DIVIDER= Divide Value */

Divide Value: 0, 1, 2, 3 ... 1023. Default is 0.

SDA_INPUT_DELAYED

SDA_INPUT_DELAYED attribute is used to add 50 ns additional delay to the SDAI signal.

/* synthesis SDA_INPUT_DELAYED= value */

Value:

0: No delay.

1: Add 50 ns delay. (Default value).

SDA_OUTPUT_DELAYED

SDA_OUTPUT_DELAYED attribute is used to add 50 ns additional delay to the SDAO signal.

/* synthesis SDA_OUTPUT_DELAYED= value */

Value:

0: No delay (Default value).

1: Add 50 ns delay.

I2C_FIFO_ENB

"I2C FIFO ENB" attribute is used to enable or disable FIFO

/* synthesis I2C FIFO ENB= [value] */

Value:

ENABLED: FIFO mode is enabled. DISABLED: FIFO mode is disabled.

7.4. iCE40 UltraPlus Hard Macros

This section describes the following dedicated hard macro primitives available in iCE40 UltraPlus device.

- SB HFOSC
- SB LFOSC
- SB RGBA DRV
- SB_LEDDA_IP
- SB_IO_OD
- SB_I2C
- SB_SPI
- SB_MAC16
- SB SPRAM256KA
- SB_IO_I3C

7.4.1. SB HFOSC

SB_HFOSC primitive generates 48 MHz nominal clock frequency within +/- 10% variation, with user-programmable divider value of 1, 2, 4, and 8. The HFOSC can drive either the global clock network or fabric routes directly based on the clock network selection.

Figure 7.26. SB_HFOSC

© 2016-2021 Lattice Semiconductor Corp. All Lattice trademarks, registered trademarks, patents, and disclaimers are as listed at www.latticesemi.com/legal.

All other brand or product names are trademarks or registered trademarks of their respective holders. The specifications and information herein are subject to change without notice.

Table 7.38. SB_HFOSC Port Signals

| Signal Name | Direction | Description |
|-------------|-----------|--|
| CLKHFPU | Input | Power up the HFOSC circuit. After power up, the oscillator output is stable after 100 μs. Active High. |
| CLKHFEN | Input | Enable the clock output. Enable should be low for the 100 μ s power up period. Active High. |
| CLKHF | Output | HF Oscillator output. |

Parameters

Table 7.39. SB_PLL40_CORE Parameters

| Parameter | Parameter Values | Description |
|-----------|------------------|---------------------------|
| CLKHF_DIV | "0b00" | Sets 48 MHz HFOSC output. |
| | "0b01" | Sets 24 MHz HFOSC output. |
| | "0b10" | Sets 12 MHz HFOSC output. |
| | "0b11" | Sets 6 MHz HFOSC output |

Default Signal Values

The iCEcube2 software assigns the following signal value to unconnected port:

Input CLKHFEN: Logic "0" Input CLKHFPU: Logic "0"

Clock Network Selection

By default, the oscillator use one of the dedicated clock networks in the device to drive the elements. You may configure the oscillator to use the fabric routes instead of global clock network using the synthesis attribute.

Synthesis Attributes

```
/* synthesis ROUTE_THROUGH_FABRIC = <value> */
```

0: Use dedicated clock network. Default option.

1: Use fabric routes.

Verilog Instantiation

```
SB_HFOSC OSCInst0 (
.CLKHFEN(ENCLKHF),
.CLKHFPU(CLKHF_POWERUP),
.CLKHF(CLKHF)
) /* synthesis ROUTE_THROUGH_FABRIC= [0|1] */;
defparam OSCInst0.CLKHF_DIV = "0b00";
```

7.4.2. SB_LFOSC

SB_LFOSC primitive generates 10 kHz nominal clock frequency within +/- 10% variation. There is no divider on the LFOSC.

The LFOSC can drive either the global clock network or fabric routes directly based on the clock network selection.

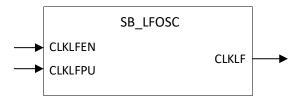

Figure 7.27. SB_LFOSC

Table 7.40. SB_LFOSC Port Signals

| Signal Name | Direction | Description |
|-------------|-----------|--|
| CLKLFPU | Input | Power up the LFOSC circuit. After power up, the oscillator output is stable after 100 μs. Active High. |
| CLKLFEN | Input | Enable the clock output. Enable should be low for the 100 μs power up period. Active High. |
| CLKLF | Output | LF Oscillator output. |

Default Signal Values

The iCEcube2 software assigns the following signal value to unconnected port:

Input CLKLFEN: Logic "0" Input CLKLFPU: Logic "0"

Clock Network Selection

By default, the oscillator use one of the dedicated clock networks in the device to drive the elements. You may configure the oscillator to use the fabric routes instead of global clock network using the synthesis attribute.

Synthesis Attributes

/* synthesis ROUTE_THROUGH_FABRIC = <value> */

Value:

0: Use dedicated clock network. Default option.

1: Use fabric routes.

Verilog Instantiation

7.4.3. SB_RGBA_DRV

SB_RGBA_DRV primitive is the RGB LED drive module which contains three dedicated open drain I/O pins for RGB LED outputs. Each of the RGB LED output is bonded out together with an SB_IO_OD primitive to the package pin. You can either use SB_RGB_DRV primitive or the SB_IO_OD primitive to drive the package pin, but not both.

The primitive allows configuration of each of the three RGB LED outputs individually. When the RGBx_CURRENT parameter of RGBx output is set to "0b000000", then SB_IO_OD can be used to drive the package pin.

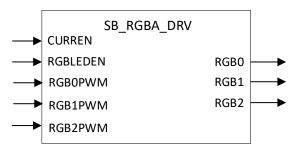

Figure 7.28. SB_RGBA_DRV

Table 7.41. SB_RGBA_DRV Port Signals

| Signal Name | Direction | Description |
|-------------|-----------|--|
| CURREN | Input | Enable the mixed signal control block to supply reference current to the IR drivers. When it is not enabled (CURREN=0), no current is supplied, and the IR drivers are powered down. Enabling the mixed signal control block takes 100 µs to reach a stable reference current value. |
| RGBLEDEN | Input | Enable the SB_RGB_DRV primitive. Active High. |
| RGB0PWM | Input | Input data to drive RGB0 LED pin. This input is usually driven from the SB_LEDD_IP. |
| RGB1PWM | Input | Input data to drive RGB1 LED pin. This input is usually driven from the SB_LEDD_IP. |
| RGB2PWM | Input | Input data to drive RGB2 LED pin. This input is usually driven from the SB_LEDD_IP. |
| RGB0 | Output | RGB0 LED output. |
| RGB1 | Output | RGB1 LED output. |
| RGB2 | Output | RGB2 LED output. |

Default Signal Values

The iCEcube2 software assigns the following signal value to unconnected port:

Input CURREN : Logic "0"
Input RGBLEDEN : Logic "0"
Input RGB0PWM : Logic "0"
Input RGB1PWM : Logic "0"
Input RGB2PWM : Logic "0"

Parameters

The SB_RGBA_DRV primitive contains the following parameter and their default values:

```
Parameter CURRENT_MODE = "0b0";

Parameter values:

"0b0" = Full Current Mode (Default).

"0b1" = Half Current Mode.

Parameter RGB0_CURRENT = "0b000000";

Parameter RGB1_CURRENT = "0b000000";

Parameter RGB2_CURRENT = "0b000000";

Parameter values:

"0b000000" = 0 mA. // Set this value to use the associated SB_IO_OD instance at RGB // LED location.

"0b000001" = 4 mA for Full Mode; 2 mA for Half Mode

"0b000011" = 8 mA for Full Mode; 4 mA for Half Mode

"0b000111" = 12 mA for Full Mode; 6 mA for Half Mode.

"0b001111" = 16 mA for Full Mode; 8 mA for Half Mode

"0b011111" = 20 mA for Full Mode; 10 mA for Half Mode.

"0b111111" = 24 mA for Full Mode; 12 mA for Half Mode.
```

Verilog Instantiation

7.4.4. SB_LEDDA_IP

SB_LEDDA_IP primitive generates the RGB PWM outputs for the RGB LED drivers. The IP contains registers that are programmed in by the SCI bus interface signals.

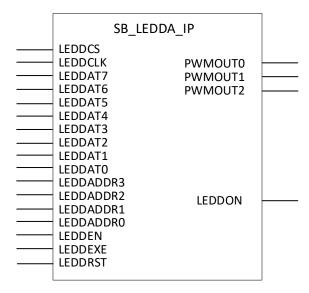

Figure 7.29. SB_LEDDA_IP

Table 7.42. SB_LEDDA_IP Port Signals

| Signal Name | Direction | Description |
|-------------|-----------|---|
| LEDDCS | Input | CS to write LEDD IP registers |
| LEDDCLK | Input | Clock to write LEDD IP registers |
| LEDDDAT7 | Input | Bit 7 data to write into the LEDD IP registers |
| LEDDDAT6 | Input | Bit 6 data to write into the LEDD IP registers |
| LEDDDAT5 | Input | Bit 5 data to write into the LEDD IP registers |
| LEDDDAT4 | Input | Bit 4 data to write into the LEDD IP registers |
| LEDDDAT3 | Input | Bit 3 data to write into the LEDD IP registers |
| LEDDDAT2 | Input | Bit 2 data to write into the LEDD IP registers |
| LEDDDAT1 | Input | Bit 1 data to write into the LEDD IP registers |
| LEDDDAT0 | Input | Bit 0 data to write into the LEDD IP registers |
| LEDDADDR3 | Input | LEDD IP register address bit 3 |
| LEDDADDR2 | Input | LEDD IP register address bit 2 |
| LEDDADDR1 | Input | LEDD IP register address bit 1 |
| LEDDADDR0 | Input | LEDD IP register address bit 0 |
| LEDDDEN | Input | Data enable input to indicate data and address are stable. |
| LEDDEXE | Input | Enable the IP to run the blinking sequence. When it is LOW, the sequence stops at the nearest OFF state. |
| LEDDRST | Input | Device level reset signal to reset all internal registers during the device configuration. This port is not accessible to user signals. |
| PWMOUT0 | Output | PWM output 0 |
| PWMOUT1 | Output | PWM output 1 |
| PWMOUT2 | Output | PWM output 2 |
| EDDON | Output | Indicating the LED is on |

Default Signal Values

The iCEcube2 software assigns the logic "0" value to all unconnected input ports.

Verilog Instantiation

```
SB LEDDA IP PWMgen inst (
      .LEDDCS (ledd cs),
      .LEDDCLK(led clk),
      .LEDDDAT7(led ip data[7]),
      .LEDDDAT6(led ip data[6]),
      .LEDDDAT5(led ip data[5]),
      .LEDDDAT4(led ip data[4]),
      .LEDDDAT3(led ip data[3]),
      .LEDDDAT2(led ip data[2]),
      .LEDDDAT1(led ip data[1]),
      .LEDDDAT0(led ip data[0]),
      .LEDDADDR3(led ip addr[3]),
      .LEDDADDR2(led ip addr[2]),
      .LEDDADDR1(led ip addr[1]),
      .LEDDADDR0(led ip addr[0]),
      .LEDDDEN(led ip den),
      .LEDDEXE (led ip exe),
      .LEDDRST(led ip rst),
      .PWMOUTO(LED0),
      .PWMOUT1 (LED1),
      .PWMOUT2 (LED2),
      .LEDDON(led on)
```

7.4.5. SB_IO_OD

The SB_IO_OD is the open drain I/O primitive. When the tri-state output is enabled, the I/O pulls down the package pin signal to zero. The following figure and Verilog template illustrate the complete user accessible logic diagram, and its Verilog instantiation.

© 2016-2021 Lattice Semiconductor Corp. All Lattice trademarks, registered trademarks, patents, and disclaimers are as listed at www.latticesemi.com/legal. All other brand or product names are trademarks or registered trademarks of their respective holders. The specifications and information herein are subject to change without notice.

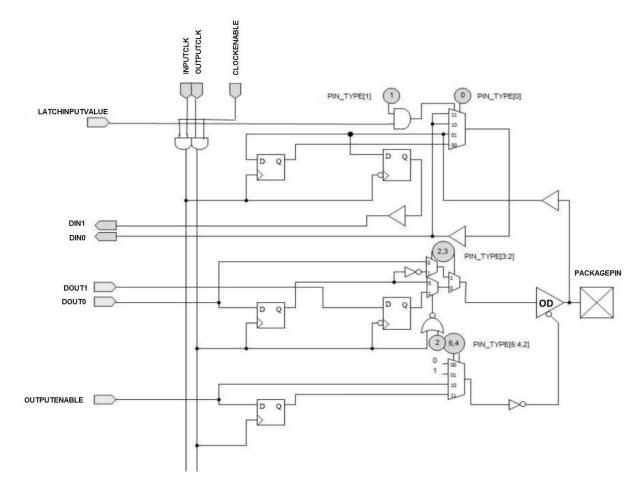

Figure 7.30. SB_IO_OD

Table 7.43. SB_IO_OD Port Signals

| Signal Name | Direction | Description |
|-----------------|---------------|--------------------------------------|
| PACKAGEPIN | Bidirectional | Bidirectional I/O pin. |
| LATCHINPUTVALUE | Input | Latches/Holds the input data. |
| CLOCKENABLE | Input | Clock enable signal. |
| INPUTCLK | Input | Clock for the input registers. |
| OUTPUTCLK | Input | Clock for the output registers. |
| OUTPUTENABLE | Input | Enable Tristate output. Active high. |
| DOUT0 | Input | Data to package pin. |
| DOUT1 | Input | Data to package pin. |
| DIN0 | Output | Data from package pin. |
| DIN1 | Output | Data from package pin. |

Default Signal Values

The iCEcube2 software assigns the logic "0" value to all unconnected input ports except for CLOCKENABLE.

Note that explicitly connecting logic "1" value to port CLOCKENABLE results in a non-optimal implementation, since extra LUT is used to generate the Logic "1". If your intention is to keep the Input and Output registers always enabled, it is recommended that port CLOCKENABLE to be left unconnected.

Parameter Values

```
Parameter PIN_TYPE = 6'b000000;

// See Input and Output Pin Function Tables in SB_IO.

// Default value of PIN_TYPE = 6'b000000

Parameter NEG_TRIGGER = 1'b0;

// Specify the polarity of all FFs in the I/O to be falling edge when NEG_TRIGGER = 1.

Default is 1'b0, rising edge.
```

Input and Output Pin Function Tables

Refer SB_IO Input and Output Pin Functional Table for the PIN_TYPE settings. Some of the output pin configurations are not applicable for SB_IO_OD primitive.

Verilog Instantiation

```
SB_IO_OD
            OpenDrainInst0
(
PACKAGEPIN (PackagePin),
                                           //User's Pin signal name
LATCHINPUTVALUE (latchinputvalue),

Parameters

Table 7.45. SB_I2C Parameters

| I ² C Location | Parameter | Parameter Default Value | Description |
|---------------------------|---------------------|-------------------------|--|
| Upper Left Corner | I2C_SLAVE_INIT_ADDR | 0b1111100001 | Upper Bits <9:2> can be changed through control registers. Lower bits <1:0> are fixed. |
| | BUS_ADDR74 | 0b0001 | Fixed value. SBADRI [7:4] bits also should match with this value to activate the IP. |
| Upper Right Corner | I2C_SLAVE_INIT_ADDR | 0b1111100010 | Upper Bits <9:2> can be changed through control registers. Lower bits <1:0> are fixed. |
| | BUS_ADDR74 | 0b0011 | Fixed value. SBADRI [7:4] bits also should match with this value to activate the IP. |

Synthesis Attribute

I2C_CLK_DIVIDER

Synthesis attribute "I2C_CLK_DIVIDER" is used by PNR and STA tools for optimization and deriving the appropriate clock frequency at SCLO output with respect to the SBCLKI input clock frequency.

/* synthesis I2C_CLK_DIVIDER= Divide Value */ Divide Value: 0, 1, 2, 3 ... 1023. Default is 0.

SDA_INPUT_DELAYED

SDA_INPUT_DELAYED attribute is used to add 50 ns additional delay to the SDAI signal.

/* synthesis SDA_INPUT_DELAYED= value */

Value:

- 0: No delay.
- 1: Add 50 ns delay. (Default value).

164

SDA_OUTPUT_DELAYED

SDA_OUTPUT_DELAYED attribute is used to add 50 ns additional delay to the SDAO signal.

/* synthesis SDA_OUTPUT_DELAYED= value */

Value:

0: No delay (Default value).

1: Add 50 ns delay.

SCL_INPUT_FILTERED

SCL_INPUT_FILTERED attribute is used to add 50 ns glitch filter to the SCLI signal.

/* synthesis SCL_INPUT_FILTERED= value */

Value:

0: No Filter delay (Default value).

1: Add 50 ns glitch filter delay.

7.4.6. SB SPI

The iCE40 UltraPlus device supports two SPI hard IP primitives, located at lower left corner and lower right corner of the chip.

Table 7.46. SB_SPI Port Signals

| Signal Name | Direction | Description |
|-------------|-----------|---|
| SBCLKI | Input | System Clock input. |
| SBRWI | Input | System Read/Write Input. |
| SBSTBI | Input | Strobe Signal |
| SBADRI0 | Input | System Bus Control registers address. Bit 0. |
| SBADRI1 | Input | System Bus Control registers address. Bit 1. |
| SBADRI2 | Input | System Bus Control registers address. Bit 2. |
| SBADRI3 | Input | System Bus Control registers address. Bit 3. |
| SBADRI4 | Input | System Bus Control registers address. Bit 4. |
| SBADRI5 | Input | System Bus Control registers address. Bit 5. |
| SBADRI6 | Input | System Bus Control registers address. Bit 6. |
| SBADRI7 | Input | System Bus Control registers address. Bit 7. |
| SBDATI0 | Input | System Data Input. Bit 0. |
| SBDATI1 | Input | System Data input. Bit 1. |
| SBDATI2 | Input | System Data input. Bit 2. |
| SBDATI3 | Input | System Data input. Bit 3. |
| SBDATI4 | Input | System Data input. Bit 4. |
| SBDATI5 | Input | System Data input. Bit 5. |
| SBDATI6 | Input | System Data input. Bit 6. |
| SBDATI7 | Input | System Data input. Bit 7. |
| SBDATO0 | Input | System Data Output. Bit 0. |
| SBDATO1 | Input | System Data Output. Bit 1. |
| SBDATO2 | Input | System Data Output. Bit 2. |
| SBDATO3 | Input | System Data Output. Bit 3. |
| SBDATO4 | Input | System Data Output. Bit 4. |
| SBDATO5 | Input | System Data Output. Bit 5. |
| SBDATO6 | Input | System Data Output. Bit 6. |
| SBDATO7 | Input | System Data Output. Bit 7. |
| SBACKO | Output | System Acknowledgement |
| SPIIRQ | Output | SPI Interrupt output. |
| SPIWKUP | Output | SPI Wake Up from Standby signal. |
| MI | Input | Master Input from PAD |
| SO | Output | Slave Output to PAD |
| SOE | Output | Slave Output Enable to PAD. Active High. |
| SI | Input | Slave Input from PAD |
| MO | Output | Master Output to PAD |
| MOE | Output | Master Output Enable to PAD. Active High. |
| SCKO | Output | Slave Clock Output to PAD |
| SCKOE | Output | Slave Clock Output Enable to PAD. Active High. |
| SCSNI | Input | Slave Chip Select Input From PAD |
| MCSNO0 | Output | Master Chip Select Output to PAD. Line 0. |
| MCSNO1 | Output | Master Chip Select Output to PAD. Line 1. |
| MCSNO2 | Output | Master Chip Select Output to PAD. Line 2. |
| MCSNO3 | Output | Master Chip Select Output to PAD. Line 3. |
| MCSNOE0 | Output | Master Chip Select Output Enable to PAD. Active High. Line 0. |
| MCSNOE1 | Output | Master Chip Select Output Enable to PAD. Active High. Line 1. |
| MCSNOE2 | Output | Master Chip Select Output Enable to PAD. Active High. Line 2. |
| MCSNOE3 | Output | Master Chip Select Output Enable to PAD. Active High. Line 3. |

Parameters

SPI Primitive requires configuring a parameter for selecting the SPI IP location.

Table 7.47. SB_SPI Parameters

| SPI Location | Parameter | Parameter Default Value | Description |
|--------------------|------------|-------------------------|---|
| Lower Left Corner | BUS_ADDR74 | 060000 | Fixed value. SBADRI[7:4] bits also should match with this value to activate the IP. |
| Lower Right Corner | BUS_ADDR74 | 060010 | Fixed value. SBADRI[7:4] bits also should match with this value to activate the IP. |

Synthesis Attribute

Synthesis attribute "SPI_CLK_DIVIDER" is used by PNR and STA tools for optimization and deriving the appropriate clock frequency at SCKO output with respect to the SBCLKI input clock frequency.

/* synthesis SPI_CLK_DIVIDER=[Divide Range] */ Divide Range : 0, 1, 2, 3....63. Default is 0.

7.4.7. SB_MAC16

The SB_MAC16 primitive is the dedicated configurable DSP block available in iCE5LP/iCE40 UltraPlus devices. The SB_MAC16 can be configured into a multiplier, adder, subtracter, accumulator, multiply-add and multiply-sub through the instance parameters. The SB_MAC16 blocks can be cascaded to implement wider functional units.

iCEcube2 supports a set of predefined SB_MAC16 functional configurations. Refer to SB_MAC16 section for the SB_MAC16 functional model, port details, and the list of supported configurations.

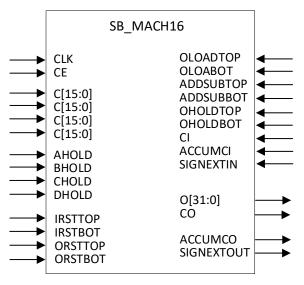

Figure 7.33. SB_MAC16

Port B (Generated Clock)

7.4.8. SB_SPRAM256KA

The iCE40 UltraPlus devices offer four embedded memory blocks of Single Port RAM. Each of these blocks can be configured in 16 kb x 16 mode. These RAM blocks can be cascaded using logic implemented in the fabric to create larger memories.

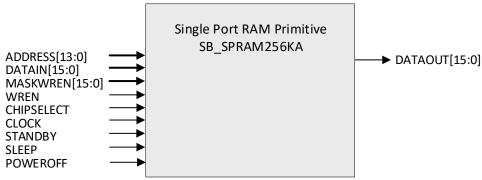

Figure 7.34. SB_SPRAM256KA

Table 7.48. SB_SPRAM256KA Ports

| Port Name | Port Width | Default Value | Description |
|------------|------------|--------------------------|--|
| ADDRESS | [13:0] | 14b'000000 00000000 | This Address input port is used to address the location to be written during the write cycle and read during the read cycle. |
| DATAIN | [15:0] | 16b'000000 0000000000 | The data input bus used to write the data into the memory location specified by address input port during the write cycle. |
| MASKWREN | [3:0] | 4b'1111 | The Bit Write feature where selective write to individual I/O can be done using the Maskable Write Enable signals. Each bit masks a nibble of DATAIN. |
| WREN | [0:0] | 1b'0 | When the Write Enable input is Logic High, the memory is in the write cycle. When the Write enable is Logic Low, the memory is in the Read Cycle. |
| CHIPSELECT | [0:0] | 1b'0 | When the memory enable input is Logic High, the memory is enabled and read/write operations can be performed. When memory Enable input is logic Low, the memory is deactivated. |
| CLOCK | [0:0] | - | This is the external clock for the memory. |
| STANDBY | [0:0] | 1b'0 | When this pin is active then memory goes into low leakage mode, there is no change in the output state. |
| SLEEP | [0:0] | 1b'0 | This pin shut down power to periphery and maintain memory contents. The outputs of the memory are pulled low. |
| POWEROFF | [0:0] | 1b'1 | This pin turns off the power to the memory core when it is driven low (1'b0). There is no memory data retention when it is driven low. When POWEROFF is driven high (1'b1), the SPRAM is powered on. |
| DATAOUT | [15:0] | - | It outputs the contents of the memory location addressed by the Address Input signals. |

The default value of each MASKWREN is 1. In order to mask a nibble of DATAIN, the MASKWREN needs to be pulled low (0).

The following shows which MASKWREN bits enables the mask for the DATAIN nibbles.

- MASKWREN(3) enables mask for DATAIN(15:12)
- MASKWREN(2) enables mask for DATAIN (11:8)
- MASKWREN(1) enables mask for DATAIN (7:4)
- MASKWREN(0) enables mask for DATAIN(3:0)

7.4.9. SB IO I3C

The iCE40 UltraPlus devices contain two special purpose I/O blocks. These blocks are same as SB_IO, but have two additional user control signals PU_ENB, WEAK_PU_ENB to enable/disable the resistor networks. These blocks are useful in I3C applications.

The SB_IO_I3C block contains five registers. The following figure and Verilog template illustrate the complete user accessible logic diagram, and its Verilog instantiation.

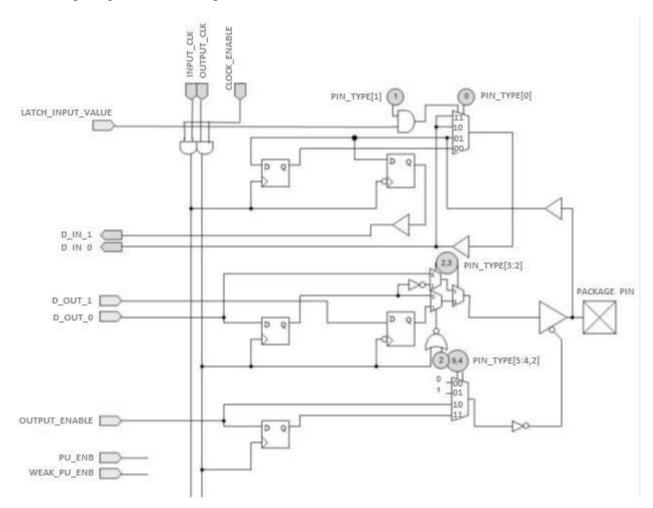

Figure 7.35. SB_IO_I3C

Default Signal Values

The iCEcube2 software assigns the logic '0' value to all unconnected input ports except for CLOCK_ENABLE.

Note that explicitly connecting a logic '1' value to port CLOCK_ENABLE results in a non-optimal implementation, since an extra LUT is used to generate the Logic '1'. If your intention is to keep the Input and Output registers always enabled, it is recommended that port CLOCK_ENABLE be left unconnected.

Explicitly connecting a logic "0" value to port PU_ENB and/or WEAK_PU_ENB results and extra LUTs are used to generate the Logic "0". If it is intended to always enable the pull-up and/or weak pull-up, it is recommended the associated port be left unconnected.

Input and Output Pin Function Tables

Input and Output functions are independently selectable through the PIN_TYPE [1:0] and PIN_TYPE [5:2] parameter settings respectively. Specific I/O functions are defined by the combination of both attributes. This means that the complete number of combinations is 64, although some combinations are not valid and not defined below.

Note that the selection of I/O Standards such as LVCMOS is not defined by these tables.

Table 7.49. Input Pin Function

| # | Pin Function Mnemonic | PIN_TYPE[1:0] | | Functional Description of Package Pin Input Operation |
|---|----------------------------|---------------|---|---|
| 1 | PIN_INPUT | 0 | 1 | Simple input pin (D_IN_0) |
| 2 | PIN_INPUT_LATCH | 1 | 1 | Disables internal data changes on the physical input pin by latching the value. |
| 3 | PIN_INPUT_REGISTERED | 0 | 0 | Input data is registered in input cell |
| 4 | PIN_INPUT_REGISTERED_LATCH | 1 | 0 | Disables internal data changes on the physical input pin by latching the value on the input register |
| 5 | PIN_INPUT_DDR | 0 | 0 | Input 'DDR' data is clocked out on rising and falling clock edges. Use the D_IN_0 and D_IN_1 pins for DDR operation. |

Table 7.50. Output Pin Function

| # | Pin Function Mnemonic | PIN_ | TYPE | [5:2] | | Functional Description of Package Pin Output Operation |
|----|--|------|------|-------|---|--|
| 1 | PIN_NO_OUTPUT | 0 | 0 | 0 | 0 | Disables the output function |
| 2 | PIN_OUTPUT | 0 | 1 | 1 | 0 | Simple output pin, (no enable) |
| 3 | PIN_OUTPUT_TRISTATE | 1 | 0 | 1 | 0 | The output pin may be tri-stated using the enable |
| 4 | PIN_OUTPUT_ENABLE_REGISTERED | 1 | 1 | 1 | 0 | The output pin may be tri-stated using a registered enable signal |
| 5 | PIN_OUTPUT_REGISTERED | 0 | 1 | 0 | 1 | Output registered, (no enable) |
| 6 | PIN_OUTPUT_REGISTERED_ENABLE | 1 | 0 | 0 | 1 | Output registered with enable (enable is not registered) |
| 7 | PIN_OUTPUT_REGISTERED_ENABLE _REGISTERED | 1 | 1 | 0 | 1 | Output registered and enable registered |
| 8 | PIN_OUTPUT_DDR | 0 | 1 | 0 | 0 | Output 'DDR' data is clocked out on rising and falling clock edges |
| 9 | PIN_OUTPUT_DDR_ENABLE | 1 | 0 | 0 | 0 | Output data is clocked out on rising and falling clock edges |
| 10 | PIN_OUTPUT_DDR_ENABLE_REGIST ERED | 1 | 1 | 0 | 0 | Output 'DDR' data with registered enable signal |
| 11 | PIN_OUTPUT_REGISTERED_INVERT ED | 0 | 1 | 1 | 1 | Output registered signal is inverted |
| 12 | PIN_OUTPUT_REGISTERED_ENABLE INVERTED | 1 | 0 | 1 | 1 | Output signal is registered and inverted, (no enable function) |
| 13 | PIN_OUTPUT_REGISTERED_ENABLE _REGISTERED_INVERTED | 1 | 1 | 1 | 1 | Output signal is registered and inverted, the enable/tristate control is registered. |

Syntax Verilog Use

Output Pin Function is the bit vector associated with PIN_TYPE [5:2] and Input Pin Function is the bit vector associated with PIN_TYPE [1:0], resulting in a 6-bit value PIN_TYPE [5:0]

defparam my_generic_IO.PIN_TYPE = 6'b{Output Pin Function, Input Pin Function};

Pull-Up Resistor Configuration.

You can configure the internal pull-up resistor strength of an I/O to a predefined resistor value through the parameter settings and synthesis attributes. The PULLUP parameter setting enables one of the resistor values as given in table 1 and WEAKPULLUP parameter setting enables the 100k pull-up resistor.

The specific resistor value associated with the PULLUP parameter needs to specify through the PULLUP_RESISTOR attribute. The PULLUP_RESISTOR value is effective only when PULLUP parameter is set to 1.

Both the PULLUP and WEAKPULLUP parameters are allowed to set simultaneously. When both parameters are set the effective pull-up resistor values is [100K | | {3P3K/6P8K/10K}].

Once the required parameters, attribute values are set, the active low PU_ENB, WEAK_PU_ENB signals allows you to control the pull-up resistor network dynamically.

Synthesis Attribute Syntax:

/* synthesis PULLUP RESISTOR = "3P3K" */

Resistor Value

Table 7.51. Resistor Value

| Resistor Value | Description | |
|----------------|---------------------------------|--|
| "3P3K" | Pull-up resistor level is 3.3k. | |
| "6P8K" | Pull-up resistor level is 6.8k. | |
| "10K" | Pull-up resistor level is 10k. | |

Note: The PULLUP RESISTOR value is effective only when PULLUP parameter is set to 1.

7.5. Device Configuration Primitives

7.5.1. SB_WARMBOOT

The iCE FPGA devices permit you to load a different configuration image during regular operation. Through the use of the Warm Boot Primitive, you can load one of four pre-defined configuration images into the iCE FPGA device.

Note that this Warm Boot mode is different from the Cold Boot operation, which is executed during the initial device boot-up sequence.

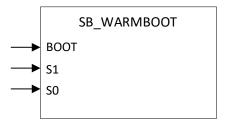

Figure 7.36. SB_WARMBOOT

The selection of one of these four images is accomplished through two input signals, S1 and S0. In order to trigger the selection of a new image, an additional signal, BOOT, is provided. It should be noted that this signal is level-triggered, and should be used for every Warm Boot operation. For example, every time you want to load a new image into the device.

The successful instantiation of this primitive also requires the user to specify the address locations of the four images. These addresses should be specified in the iCEcube2 software as per the Warm Boot Application Note.
